I am in need to of a resource for mounting the equipment to track the balloons in my F150 Truck Super Cab. Last evenng is was painfully apparent that I need some sort of mounts or a rack to mount securely and in a manner that is visible to me the following:

1. Computer
2. Radios
3. DF monitor

When I attended the 2002 GPSL I saw a set-up in a full size pick-up. I believe the mounting racks were like the ones in ambulances.

Any help or ideas on a supplier of mounting racks and brackets??

I'm interested in the various types of balloon cut-down devices in use by the various ballooning groups, what works, what doesn't, are we in need of some new ideas or is it a pretty done thing? Let me know, thanks.

One idea that I've recently seen in use on some of the UAH flights is this:

Many thanks to all who passed along information concerning the use of digital cameras in high altitude balloon payloads. It is certainly a good feeling to know that the amateur spirit of cooperation and information sharing is still alive and well! I look forward to sharing my images with you all after our flight next month.

73,

Doug Loughmiller, W5BL

Actally it is 30 fps @ 352x288 Mpeg4 and a 5MP camera.

www.2fidelity.com it is a DV5900

EOSS has been using a #28-30 NiCr coil of 1 to 2 ohms tight-wound over the lift line at the 'chute apex with good results. 2-3 #123 LiSO2 batts in series relay-swithed across the coil does the job in about 4 sec inside a 1/2" thick styrofoam enclosure.

But there are lotsa other ways to get shut of the balloon ...

Does anybody remember which presenter was using Lithium Polymer batteries in his business and offered a good price because of the volume he buys in?

From: Don KA0JLF
Topic: 1577 Message: 1577

Less payload than originally hoped for, but a successful flight. I think I heard we landed about 7.xx miles from the launchsite, about 85,xxx ft. Reports will arrive as data is unloaded and forwarded in.

Major Happy did an outstanding job on a very successful mission. What Extreme temperatures he endured. ;-) All the while with a grin and positive spirit!

Larry M flew his DVR facing down, I flew mine facing up. Now to find a way to display them side by side, with a tracking map or flight data. ;-)

My attempt to capture balloon burst and study the parachute during decent was a sucess. Periods of violent changes to the balloon are amazing.

More reports as they come in.

1579. Balloon burst photo of HS05B

Yahoo group: GPSL (2002 — 2008)
Date: 2005-08-02 12:56:14 UTC
From: Don KA0JLF
Topic: 1579 Message: 1579

The two video capsules worked great. Here is a frame
from my video capsule looking up at the balloon:
http://habitatskylab.org/BURST1.JPG

More to follow, but out of time right now.

The video is impressive to say the least. I never
realized it was so violent.

Anyone know of software/hardware that would let me
combine the two video files into one side-by-side
screen? I thought of a Quad display type thing with
the videos one looking up, one looking down, with the
flight data also.

This is magnificent, Don.

Tremendous idea. If you could do anything like that type of
video it would be absolutely awesome.

I think Mark and some of the other video pros will have some
suggestions.

Hank

I use Pinnacle Studio and know this doesn't have the capability. You
may need a near-professional video editing solution. You might ask on
the EOSS or ANSR lists as some of those guys have used such software.

Agree with Hank that this is an excellent frame capture. I may just
have to put an upward looking camcorder on one of my future flights.
There's only so much footage of the Iowa/Nebraska horizon that I need.

1582. Video quad-view possibility

Yahoo group: GPSL (2002 — 2008)

From: Ralph Wallio, W0RPK
Topic: 1582 Message: 1582

Don,

A very interesting project!

I am not aware of reasonably priced software that can assemble something akin to quad-view or picture-in-picture from DVI files. There are, however, a few inexpensive (<=$100) quad-view hardware choices available. You could feed composite video from multiple sources to the multiple inputs of this hardware and synchronize these sources within ~1sec tolerance (see http://www.qvcvideo.com/main/products/?category=25&bcat=37 for examples).

I assume two of these sources would come from your DVI cameras. You could convert your APRS file to formatted video text with something akin to a BOB-III and synchronize it within a similar tolerance (see http://www.decadenet.com/ for BOB-III info).

Multi-window composite video output could then be recorded to tape or DVD.

Hmmm, what to do with the 4th window ...

I have Adobe Premiere for editing video. I'll be happy to help however I can. Did you record the video using a DV type camera (mini-DV tapes)? Do you have the AVI capture files? If you have high speed Internet, we can exchange the files via FTP.

I have Premier Pro and while I was out of town for 2 months I discovered I needed to do a quick video edit so purchased Premier Elements, Adobe's lightweight video editor. I was mightily impressed. Anyway, Premier Pro would have no problem with this, but do you want to spend that kind of money? And Premier Elements is "only" around $100. I actually purchased a combo package that contained both Premier Elements and Photoshop Elements as it was on sale for $130 or so. I just checked to be sure and you can run 4 video tracks. So you could easily import the 2 videos, scale them to quarter screen and add telemetry or perhaps other video in the spare two quadrants.

One nice thing I discovered about Premier Elements. It has more codecs built in. It can read the video files from my stable of Canon Powershot cameras. Premier Pro can't. But, I'll probably install Elements on the main system and get access to all the codecs in both programs when that happens.

Oh, and I'm not volunteering to edit! :-) Since Mike must have an Internet2 grade data connection I defer to him. I'm on lowly broadband running around a megabit per second. Would be just too agonizing to download your video at full miniDV/AVI capture mode (250 megabytes per minute more or less).

1585. Re: LIFTWIN available balloon types

Yahoo group: GPSL (2002 — 2008)
Date: 2005-08-03 13:06:08 UTC
From: Hank
Topic: 1470 Message: 1585

Harry,

There are a few things I'd like to ask you off list, but
that still leaves several points you've raised that can
be addressed here which might be of general interest.

> I have tried interpolating between manuf. & sizes with a
> lot of mixed results..

[the following is not directed to you Harry, but to those
other users of LIFTWIN on this list]

------begin contacting software author suggestions------

Anytime you have documented results, or even undocumented,
you can email me for thought, comments, or possible
explanations. By documented results I mean things like
your actual vs. predicted ascent velocity and how much gas
was used. Not necessary to know every detail like air
temperature at launch site.

Please do not depend on my reading your requests on ANY
mail list, Yahoo or otherwise. Recent programs contain
my amsat email address (I think the old ones as well), and
it's also in QRZ. I reply fully in email, and am known to
get on the phone to help with more complicated situations
that would be too slow and tedious by email.

n1ltv@...

------end contacting software author suggestions------

> I even called Kaysam a while back & they didn't even have
> records of these.

If *they* don't, there's nothing I can do about this in
LIFTWIN. It's not atypical for a company to not know,
or to not bother to find out, about older products no
longer made.

> What I have more of are labeled "Kaysam SW16" dated (2001).
> They weigh out to be 825-850g. I have been getting 1100-1300
> fpm when LW says 900 fpm.

The burst height is dependent on factors which are under
the control of the balloon maker. The ascent speed is a
more fundamental value which is *not* a first order function
of balloon manufacture aside from its weight.

This error you mention of 1100-1300 instead of 900 is something totally *unrelated* to any qualities of the balloon that you'd need to get from Kaysam.

I'd like to discuss this off list with you Harry further because you can certainly do better, on average, with the ascent speed than that.

Harry and I have already discussed interpolation and other workarounds.

Hank

1586. Re: LIFTWIN available balloon types

> I forgot to mention that at one time I wanted a (-) negative
> burst adjustment in LiftWin and was suprised I couldn't.

I don't think that negative burst adjust will be needed
much, but I could be wrong. This is the very first time
I ever heard someone could have used that, or thinks he
could have used that. It's actually a distinct possibilty
that your overly fast ascent speed and lower burst height
are related, and better solved by better fundamental inputs
to the program, rather than relying on adjustment factors.

If I don't know people need it, it might not ever appear in
the program.

The moral: talk to your software authors. If it's someone
like Rick, chances are pretty good your wish will be granted.
With me the chances aren't nearly as good because, among other
reasons, I don't mess with the product often.

The burst adjustment feature itself was added by user request.

> I've got LiftWin 0.41, and the set profile feature is still under
> construction in that version. Is there a newer one out there now?

Mike,

I had totally forgotten that the vestige of profile code is
mistakenly in that .41 release! I rushed it onto the website
ages ago for TVNSP to use, and think at that time knew the
profile was in there, and the thought was to take it out in a
week or so when I had a chance. It never happened, the profile
is still there, and it was only recently that I rediscovered it.
Someone might have told me. The program development source code
and tools are in another, now unused, computer or it would be
fixed by now.

There is no newer version than LW .41.

> BTW, Liftwin hit our numbers re ascent rate right on for
> GPSL 05, but predicted a bit higher burst (that's very
> unit-specific!).

Just as with balloon landing predictions, right-on LW
predictions occur by chance. But thanks for
mentioning it. :)

As for the burst, you're exactly right about it definitely
being unit-specific, and it's also *sensitive* to the actual
cubic feet pumped into the balloon.

> Keep up the good work, and drop by GPSL sometime, eh?

Thank you on both counts, but two (humorous) thoughts
about GPSL:

1. Do consider running GPSL in New England or New York
soon. :) Chances are very good I'll be stopping by.

2. Until that radical change of venue, I'll continue to
apply for NSF and Space Grant money to travel to these
wonderful GPSLs. :) I guess I could also dip into
that pile of money I've been informed is waiting for me
in Nigeria.

> It's a real gas ...

Was that really necessary, Mike? :) Up to that point
you were being good. :)

Mike Who? I have a 1st Class 56K dialup, I'm here to tell ya!
So PUHLEEZ don't ship me anything over 1 Meg.

Hey, Don, nice hi-res color shot of the burst. EOSS got a similar
picture from the ATV downlink back about EOSS-16 or so. Merle saved off
JPEGS of each frame, and we show that "album" of about 10 pix showing
the
progress of the burst in 32 msec increments. The video was about P4 &
B/W,
but it's a real attraction at hamfests. And someone told me that they
were used to brief NASA or some other agency on burst behavior. Betcha
yer P5 color video frame grab series would be even prettier!

Ahh, how quickly they forget! :-)

We got some strong P3 possibly P4 video of the burst from ATV aboard EOSS-086. You can see this video which also (in the longer version) shows the de-spinner at work. The series of stills Mike was mentioning from EOSS-030 are also at the website. You can see this stuff by visiting our Cool Stuff page:

http://www.eoss.org/cool_stuff.htm

There are links to things on our website I particularly like but, I'm open to suggestions if I've left out any memorable pictures, videos, sound files etc.

And don't worry, MM that was MG (Mike Gray from Ansr) who offered to accept the video files via FTP. No matter what, they're too big for anything but ftp. I don't think I know of an email system that can handle individual attachments over 50 megs at present. But, that will probably change in the future as connect speeds continue to inch up to the Korean standards (20 Mbps)

Everyone keep in mind this photo was a frame grabbed
from our 'cheap' ($120) video camera from Wal-Mart.
The video is 352x288 (quarter VGA). This is the one
discussed on here and other groups a week or so ago.

I again say, I'm pleased with it! ;-)

1591. ARHAB 2005 contests - standings through July

Yahoo group: GPSL (2002 — 2008)
Date: 2005-08-05 12:55:51 UTC
From: Ralph Wallio, W0RPK
Topic: 1591 Message: 1591

Current standings in ARHAB 2005 contests:

Altitude - 5 entries - 118,352ft ISU/HABET (#1- 120,522ft)
Track distance - 2 entries - 174.3mi GPA DIY ZP (#1- 1,201.18mi)
Flight time - 2 entries - 5:46:12 GPA DIY ZP (#1- 22:42:11)
>50MHz telemetry - 2 entries - 190.8mi W0RPK/KUBEsat (#1- 479.5mi)
<50MHz telemetry - 0 entries (#1- 2,437mi)
QSO - 0 entries (#1- 647mi EBE)

Heard in the static:

A few more altitude attempts
Nothing about distance and time
>50MHz distance will increase (by me at least)
Nothing about HF telemetry payloads
Multiple repeaters yet to fly

Comments:

We know how to float for time and distance - are there secret projects?
Where are the HF telemetry payloads?
Multiple repeaters have flown but why no entries?

1592. Re: [GPSL] Re: LIFTWIN available balloon types

Yahoo group: GPSL (2002 — 2008)
Date: 2005-08-05 15:07:46 UTC
From: Mike Manes
Topic: 1470 Message: 1592

Hi Hank,

Thanks for providing LiftWin to the balloon community. It sure is
a handy tool if one recognizes that latex balloons are not built
like Swiss watches. It helps pick the right balloon for the job, and
if one fills per its advice for about 1000 fpm, it won't stall and
will hit the predicted burst altitude, give or take 10K ft.

Hmmm ... a GPSL out of New England, huh? Well, you might consider
coming up with a modified expansion for the "GP" part ... Great Pines,
e.g.?

Good luck with all o' them Nigerian scambucks ... might consider
a generous donation to an NGO taking care of those starving orphans :={

And my apologies for the balllooncy pun ... this stuff does have its
ups and downs, y'know.

1593. Re: [GPSL] ARHAB 2005 contests - standings through July

Yahoo group: GPSL (2002 — 2008)
Date: 2005-08-05 16:43:38 UTC
From: Mike Manes
Topic: 1591 Message: 1593

Hi Ralph,

Re altitude: big balloon, proper fill and light neck load are the
secrets. Gets pricey. We'll see how our surplus 7000 gm bag does
with about 5 lb on the neck on EOSS-98 ...

Re floating: the risk of going derelict, spending a long time tracking
and driving a long way for recovery are disincentives to bettering
on purpose what's been done accidentally to date. EOSS did one with
Norm Kjome and the USAFA way back using a ZP plastic. It hit 100K' and
stayed there for 8 hours, making a 200-mike long oval in the
stratosphere and returning to the original float position where cutdown
was commanded.

Re HF beacons: merely interesting, since altitude doesn't help
ionospheric skip DX. And ground wave attenuation is much worse on
HF than on VHF, especially if one is using a short, inefficient antenna.
Signal reports from 1000 mi away after landing are amusing, but don't
help recovery if you gotta be within a few hundred yards to DF it. (But
if the DX station can call in APRS reports ... 'nother story!).

Re EBBE: Didn't HABITAT turn that trick last year? And I did log your
UI text to me via NSTAR and EOSS while I was navigating with N0KKZ
during
GPSL 2004, but didn't notice it until poring over the log file the
next day. Had you tried C W5VSI-1 via EOSS, NSTAR then it woulda
sounded
the connect bell on the laptop sitting on the floor.

From: Ralph Wallio, W0RPK
Topic: 1591 Message: 1594

Hi Mike,

Responding to your comments:

We appear to have evidence that big balloons lifting light payloads don't necessarily set altitude records. Pete Sias has three entries in our altitude category, #5, #6 and #11, that were 3000g balloons lifting ~2.5lbs. All three segued to floating below record altitude. Note that our 2004 altitude record by TVNSP (#2 all-time record) was with a 1200g balloon lifting 1.1lbs. There appears to be a problem here that brute force does not necessarily solve.

We know when and how high to float for time with very little lateral track (including during September +/-). It would be just as recoverable as any up-and-down flight. We know when and how high to float for maximum distance (Nov-Jan +/-). Throw-away APRS payloads ($100-200) could be flown coast-to-coast and cut-away over blue water. I do not consider a floater above 60kft to be derelict. Flights can be designed and managed to float well above controlled airspace and be reliably cut-down. We know how to do it all.

HF telemetry allows flight participation by Hams well beyond VHF/UHF horizon. In my opinion this is a worthy goal with ionospheric propagation of slow speed telemetry. Given notice via e-mail lists and bulletins there would be many distant participants. Low SNR modes, e.g., CW and PSK-31, allow use of very low power. 1W would be successful as it is with our QRP corps. It would be reasonable to use an efficient 33ft full-size end-fed half-wave on 20m.

Ground wave propagation on VHF is off-the-chart short and -much- shorter than HF, even 30MHz. VHF propagation for DFing is by troposcatter, not ground wave. But it is irrelevant because HF is not being flown as a DFing beacon. VHF APRS and DF beacons would still be used. Recovery methods and management would not change.

Yes, we have had EBBE QSOs and they are in the record book. However, so far they have been substantially shorter, station-to-station, than our top 10 EBE QSOs. We are flying the repeaters. We are not promoting activity at the edges of coverage nor QSO record entries.

Marty Griffin sent me a few hundred photos (actually 127 pictures) of the GPSL 2005 experience. I've put off incorporating them to the website long enough. So, I just posted 32 of them to the EOSS-092 recap page. If you go to:

http://www.eoss.org/ansrecap/ar_100/recap92.htm

And scroll down to the Photos section, everything labeled as photographed by Marty is new. Marty took lots more people photos than I did.

Check it out.

From: Mike Manes
Topic: 1591 Message: 1596

Hi Ralph,

I suspect that ascent rate (excess lift) may have a lot to do with burst altitude, but there's an apparent non-intuitive effect. On our last pair of flights July 30, we used identical 3000 balloons carrying nearly identical neck loads (23 +/- 1 lb). EOSS-96 was filled per our customary "a little more gas" protocol and developed a 1300 fpm ascent rate to a burst over 99K'.

After EOSS-96 launched, EOSS-97 was filled, but a bit lighter (there was some false lift) and hit a worrisome initial ascent rate of under 300 fpm, gradually increasing to over 600 fpm; but it ended up bursting at only about 83K'.

So a light fill in this example resulted in the expected lower ascent rate, but an unexpected LOWER burst altitude. Norm Kjome has observed this as well and theorizes that the longer UV exposure during a slow ascent may weaken the balloon skin due to breaking latex elastomer cross-links. This phenom may also reduce the elasticity of latex, which could also explain the oft-observed inflection in ascent rate in the latter third of ascent.

So it may be worthwhile to take a closer look at Paul's and Pete's initial ascent rates to see if there's any evidence of this effect.

But given a proper fill, I've got a 5-spot that sez a big balloon with a light payload is gonna go higher than a small, heavy one.

Re long-duration flights: if the flight is gonna go overnight and still stay above FL600, then there's gotta be a ballast dump. I know there are proposed schemes out there intended to achieve this, but so far, I've not seen where any are flight-proven. Another issue is battery life and thermal management in the payload. And then there's that spooky UV exposure issue ...

BTW, the FAA defines a derelict as a non-exempt balloon, the location and/or altitude of which is unknown for over 2 hours, regardless of actual altitude (they know it's gonna come down, by 'n by).

Re "throwaway" payloads: maybe after EOSS's recovery record gets its first scratch. We've worked too keep it.

Re DF beacon range: foliage, at least the type found in E. Colo, appears to attenuate 10m sigs much more than 2m when the beacon is on the deck. This has been verified empirically on several of EOSS's early flights as well as with voice comms between terrestrial stations 25 miles apart. At this and shorter range, tropo conditions are irrelevant.

Re HF PSK31 telemetry: I believe that ANSR and Gustavo LW2DTZ have done this. Not sure what best DX was, but with good skip, the limit is 12,500 miles (half Earth circumference).

Re long-haul EBBE: I don't think one can expect the BB path length to approach the EB path length, primarily due to lower-gain antennas and lower ERP. During EOSS-90, I was about 350 miles away in W. WY, and I >think< I might have heard just a peep of the DF beacon for a minute or two at apogee of 98K'. I was using a 5/8 gain mag mount on the roof of the car and two separate rcvrs. I think a long yagi and LNA woulda helped a whole lot. There's also some question about how having both stations above the tropopause may affect limiting range. ANSR and EOSS have yet to make the BB path between AZ and CO, despite favorable propagation predictions. More research is needed!

WRONG!!

In my email about combining video in an editor I made the comment below. That comment is in error. At least to the extent that the codec to play videos from Canon Powershot cameras is concerned.

For those interested, here is the real story. Originally it was in this email but, the majority of you probably don't want to read the whole story. I did find out what was going on and how to cure it.

http://www.vonglahn.com/video_codec.htm

Don,

This looks like a capable gizmo. Do you have any samples
of straight jpegs done with this camera in still mode on
your website at present?

I'd like to see how it performs that way.

Hank

All,

After checking around the 'net and reading some reviews, I checked out the www.aiptek.com site and found that they had the camera that HABITAT-SKYLAB is using (the DV-5900) either new or refurbished. (Could not find one at a Walmart.)

The refurb price was $119.00 and the new price is $150.00
Guess which one I bought ?

Anyway, there were a couple of reviews that made a reference to the to big improvements make between the previous model (DV4100) and this one. Add the ability to use 1gb SD as opposed to 512mb and I figured the extra $20 was worth it.

I thought about the next step up, th IS-DV, but I'm not as sure about the Li-Lon batteries as I'd like to be. Refurbs are only $10 more but the kickers were - "none of the improvements added any video time", "they had the same number of pixels" and "somebody else has done it with the DV-5900 so we should be able to get it to work".

We plan on flying it on 27-Sep or 15-Oct. We'll post the results.

Like Don, I'd sure like to point one up and one down :-) Getting good information about 'post-burst chaos' would make it easier to design some sort of 'burst detector' that you let you cutaway the balloon at burst automatically instead of just guess at it.

Don... Did you use external batteries ? If not, what did you use and how did they last? Did you make any mods to the camera or just turn it on? How many minutes did 1gb hold?

Thanks!

No but I'll try to throw one up there right away. I've
got some of the mission commander "Major Happy" right
after recovery.

I don't think it was at the best resolution it will
do.

When I got mine, the Walmart at 75th & I-35 (E
frontage rd) they had several. They were in a locked
case with other cameras, clerk had to get it.

> The refurb price was $119.00 and the new price is

Mine was new, and with tax about $110.

Me too, Larry M had the older one (link sent by David)
but it was limited to the 512 MB.

We have the DV-5900 as you said before.

>

> post the results.

We have flights scheduled for 8/28/05 and 9/10/05. We should have the ATV connected to it today at our work session. Using the included A/V cable.

I think you would be surprised about the flight up too, pre-burst. I was!

> Don... Did you use external batteries ? If not,
> what did you use and how did they last?

Internal, NiMH 2300 mah, from Associated Radio, worked well. They lasted longer than I realized. Other words, I haven't timed them. However, they not only recorded the flight, but played it back several times (or parts of it). On this last flight, the record time was about 2 hours. We played it back at lunch full length (another 2 hours). I started and stopped it several times, and took some photos with it.

> Did you make any mods to the camera or just turn
> it on?

No, just turned it on and put it in the capsule.

> How many minutes did 1gb hold?

I have gotten over 2 1/2 hours, Larry M too if I remember right.

How much it will hold depends on how much the scene changes I think. But package says for a 1 GB at QVGA (352x288) 128 - 192 minutes. I'd say that is about right. Larry M got the entire flight at GPSL.

1603. DV-5900 - photos upload

Yahoo group: GPSL (2002 — 2008)
Date: 2005-08-07 17:21:45 UTC
From: Don KA0JLF
Topic: 1598 Message: 1603

3 photos of the mission commander have been added to
the http://www.habitatskylab.org web page. These are
right out of the camera, no editing or sizing etc.

Now I took these in bright sunlight minutes after the
flight, it was hard to see the LCD screen (brightness
can be adjusted I think through the menu). So it might
not be the best focus, due to operator error but it
gives you an idea. These might not be representative
of the best the camera can do, condensation after the
flight, dusty road, etc. But it gives a clue.

Oh, some other things that I haven't tried yet but did
have some interest in:
Digital voice recorder
MP3 player

Thinking of SSTV, capture on the balloon. Or digital
voice recorder of simplex repeaters, contacts etc.
RE-play pre-recorded messages (MP3 or wav?)?

The digital Video recorder did record sound during the
whole flight, even the balloon burst. This could be
used to record, received audio on one of the other
modes/radios (APRS beacons?).

1605. RE: [GPSL] Re: [Fwd: Potential Low Cost Video Camera for Balloon]]

Yahoo group: GPSL (2002 — 2008)
Date: 2005-08-07 21:40:27 UTC
From: Mark Conner
Topic: 1598 Message: 1605

At the Bellevue NE Wal-Mart, it's in a blister pack right next to the SD and CF cards in the photo area for $98. For some reason it's not on the walmart.com web site. I've seem them at a couple of other Omaha-area stores in roughly the same area. They are marked as a "Fidelity" camera, which apparently is an Aiptek division.

There are a couple of low-cost digital cameras in the same location. The 2Mp camera is $40 and the 3Mp is $60. The 2Mp version does not have a TFT display, which may be an advantage for battery life. This may be a low-cost way to add digital pictures to balloon payloads (though it will probably require wiring to a BS2p or similar timing capability).

Yes, a blister pack, largely Orange with some Black
and White.

I think I'll try to make up a shorter audio/video
cable with a right angle plug (less clearence on the
front side).

1607. Ham radio high alt. ballooning prohibited in U.K.

Yahoo group: GPSL (2002 — 2008)
Date: 2005-08-13 15:50:30 UTC
From: Hank
Topic: 1607 Message: 1607

This is amazing. I can't believe this prohibition
has lasted this long, in the UK of all places where
sat activity is high and amateur radio satellite
technical achievement so prominent.

Hank

[from http://www.qrz.com bulletin board]

A newly formed Amateur Radio group called S.O.A.R (Space Observation with Amateur Radio) is aiming to get the regulations surrounding airborne experiments changed. Project S.O.A.R intends using meteorological balloons to carry Amateur Radio experiments to altitudes in excess of 90,000 feet. Planned payloads will include cross band repeaters, ATV, APRS to name just a few. Each flight will be tracked from the ground and then recovered upon landing.

Current UK licensing restrictions do not allow the use of Amateur Radio equipment in airborne vehicles. Project S.O.A.R is currently communicating with the CAA and OFCOM in an attempt to get the conditions relaxed. The group is actively seeking change that will allow experiments of this nature in balloons and other non-commercial craft.

If the conditions surrounding airborne vehicles are relaxed, it will enable the group to provide payload space to other groups for experiments. It is envisaged that strong links will be made with schools and educational establishments with the inclusion of "SOARSAT's". These are small ping-pong ball sized experiments similar to those already in use in the USA.

Currently, the UK is the only country in the world where experiments like this are prohibited. A project of this kind has great potential and will help the Amateur Radio community cement links with educators. It seems a real shame that old fashioned thinking is restricting such an exciting and important project.

The project leader, Peter Badham G0WXJ is keen to hear from any UK based groups or individuals who are interested in becoming part of the project. Contact details and further information is available on their website

www.eham.org.uk.

1608. Balloon Burst in Telescope

Yahoo group: GPSL (2002 — 2008)
Date: 2005-08-13 21:05:50 UTC
From: PAUL VERHAGE
Topic: 1608 Message: 1608

I just got back from a balloon flight. The Centennial Observatory was able to track the balloon and get video of the burst. At burst, the balloon left a swirling vortex of talcum powder. The image was recorded in near IR to reduce the sky's light.

Has anyone recorded video of a balloon burst from the ground like this?

I'll email a copy of the footage after it is digitized.

Paul

1609. RE: [GPSL] Balloon Burst in Telescope

Yahoo group: GPSL (2002 — 2008)
Date: 2005-08-14 19:31:10 UTC
From: Rick von Glahn
Topic: 1608 Message: 1609

One of EOSS's members, Randy Reynard NQ0R, managed to do this:

http://www.eoss.org/ansrecap/ar_100/recap85.htm

He had to sit there with the telescope controller and jink it this way and that to maintain a lock on the balloon for fear of never being able to re-acquire it should it get too far away from the centerline of the observation angle.

The balloon is around 40 miles away when it bursts so the "seeing" conditions aren't that good looking through all those different parcels of air but, you can definitely see a tearing burst rather than the totex explosion and shredding burst evident in the last burst picture posted here. Hmmm, maybe that wasn't a totex at all. Well, Randy's video shows the balloon deform in a manner highly suggestive of a tear up one side and then the entire balloon turns into a streamer and plummets down the video frame out of sight.

We'll all be interested to see the talcum powder vortex.

73 -- Rick, NØKKZ

Topic: 1610 Message: 1610

I peruse the net to find new and unusual electronics
things, and I've found something that may be of
interest to members of the GPSL.

3.7V 2000Mah LIPoly flat pack batteries rated to -25C.

http://www.sparkfun.com/shop/index.php?shop=1&cart=367451&cat=87&

There is a charger avilable for them. Sparkfun also
has GPS modules and related stuff, if the group
doesn't already know about them.

I know that it's a 24 inch telescope (the second largest in Idaho, I believe) with a CCD imager that is usually used to capture images of the night sky. The magnification was 96 power and the distance between 30 and 40 miles.

I'll see if Rick can give me more info.

Paul

1617. [Weather balloon] Error may have hidden warming

Yahoo group: GPSL (2002 — 2008)
Date: 2005-08-19 17:40:43 UTC
From: Ralph Wallio, W0RPK
Topic: 1617 Message: 1617

Error may have hidden warming

http://news.bbc.co.uk/1/hi/sci/tech/4152576.stm

A dispute over the data for global warming may be down to the way sensors were placed on weather balloons when readings were taken in the 1970s. For years, experts sought to determine why temperature readings taken from weather balloons did not show the same increases as readings on the ground.

The resulting mismatch has fuelled scepticism of global warming.

Researchers at Yale University in the US say exposed instruments on the balloons may be the problem.

Weather balloons are sent up around the world twice a day and older versions of the balloons used temperature probes that were exposed.

The result, say the researchers, was higher readings on balloons sent up in daytime because of the exposure to sunlight.

After correcting for the problem, the researchers estimate there has been a global temperature increase of 0.2C (0.4F) per decade for the last 30 years.

"Unfortunately, the warming is in an accelerating trend - the climate has not yet caught up with what we've already put into the atmosphere," said lead author Steven Sherwood of Yale.

"This has muddied the interpretation. There are steps we should take, but it seems that shaking people out of complacency will take a strong incentive."

The research was funded by the US National Oceanic and Atmospheric Administration (Noaa). The findings were published in an online issue of the journal Science.

1618. slightly OT: spline or other path smoothing software

Yahoo group: GPSL (2002 — 2008)
Date: 2005-08-23 03:15:31 UTC
From: Hank
Topic: 1618 Message: 1618

I'm looking for some software, preferably freeware, to overdraw a GPS generated track so that the slight bumpiness is removed from the line.

The software should be able to operate on TIFF, GIF, or even JPEG formatted map images.

It will employ the method of spines or Bezier curves and have a mouse interface.

I'm told that Adobe Illustrator is an example of one drawing program that has this capability. Another seems to be Corel Draw from a little web searching. These are both very expensive. Freeware, shareware, or bargain basement priced (< $20) software is what is sought.

Hank

1619. Re: [GPSL] slightly OT: spline or other path smoothing software

Yahoo group: GPSL (2002 — 2008)

From: n9xtn@cox.net
Topic: 1618 Message: 1619

I take it this is to operate on a graphic when the original data is not available? In that case I don't have anything that will help. You'd probably need a high-end graphics program that would both identify and smooth a line in a TIFF, GIF, or especially a JPEG (the compression noise will make it tougher to identify a line).

I thought MS Excel would smooth 2D lines, but apparently not. I suppose you could smooth the lat and lon data independently, but that may not produce a smooth result.

Another approach may be to use PowerPoint to add a "curved" line over the track (Auto Shapes|Lines|Curve), adding and subtracting control points as necessary. You'll still have to erase the original track somehow, or copy the hand-drawn track over to a blank map of the same scale.

1620. OT: smooth curved line drawing programs / was spline .... smoothing software

Yahoo group: GPSL (2002 — 2008)
Date: 2005-08-23 14:14:10 UTC
From: Hank Riley
Topic: 1618 Message: 1620

> I take it this is to operate on a graphic when the original data is
> not available?

Mark,

It is available, but this is not a technical smoothing, it's an
esthetic smoothing. It's in the domain of the art of map making.
The track under consideration is the GPS log of a hiking path
(actually a small network of paths).

The message title has been changed to better convey the concept.

> Another approach may be to use PowerPoint to add a "curved" line over

> somehow, or copy the hand-drawn track over to a blank map of the same
> scale.

The former procedure is exactly what I want to do, and will be easy
to do since the new path line will be wider than the existing bumpy
line that has been drawn on the map image. The PC where this is being
done may already have Powerpoint installed, so that's a good tip and
worth trying.

1621. ANSR-25 Flight Announcment

Yahoo group: GPSL (2002 — 2008)
Date: 2005-08-23 16:27:14 UTC
From: kd7lmo
Topic: 1621 Message: 1621

Arizona Near Space Research (ANSR) is pleased to announce the flight of ANSR-25. This high altitude balloon flight will take place on Saturday, September 3rd at 8:00 AM MST (1500 UTC). The launch site will be announced closer to the flight date and will be based on winds aloft.

The balloon will be a 1200-gram weather balloon, filled with helium. The expected burst altitude will be 90,000 feet or more. The flight is anticipated to last about 2.5 hours from launch to touchdown.

The flight will be an attempt to set three (3) records as part of the 2005 Onset ARHAB (Amateur Radio High Altitude Ballooning Record) competition. The portion we are attempting on this flight includes:

1. VHF/UHF Greatest Telemetry Distance (APRS on 445.950 MHz)
2. HF Greatest Telemetry Distance (PSK-31 on 14070.450 KHz)
3. Greatest 2-way QSO (Cross Band Voice Repeater)

We need your assistance (especially distance stations) in an attempt to set these records. VHF/UHF stations in Southern California, New Mexico, and Colorado Mountain Tops would work best for the 2-way QSO and telemetry attempts.

Stations 800-1200 miles down range from Arizona would have the best shot at hearing the PSK-31 beacon. See the following propagation maps for best listening locations.

http://www.kd7lmo.net/psk31_propagation.html

The following is the payload frequency plan:

Cross Band NB-FM Voice Repeater
Input: 145.560 MHz/162.2 Hz PL tone
Output: 445.525 MHz

APRS when repeater not in use on 445.950 MHz at 10, 20, 40, and 50 seconds GPS time via KD7LMO-11

Landing prediction after burst at 15 and 45 seconds GPS time via KD7LMO-0

Linked to IRLP reflector 9255 * See Notes below

Pico Beacon APRS
445.950 MHz packet at 00 and 30 seconds GPS time via KD7LMO-11

Our mobile cross band Digipeater will repeat the APRS data to the 144.390 MHz standard APRS frequency and thus will be I-GATED to the

Internet for out of area trackers. You track the flight using either of the following links:

http://www.findu.com/cgi-bin/find.cgi?kd7lmo-11
http://map.aprsworld.net/kd7lmo-11

* NOTE on IRLP reflector. When you connect, the node will report you are connected to the Western States Reflector 925 on channel 5. This channel has been reserved for high altitude balloon flights. Remember to key your transmitter for 2 seconds BEFORE you begin to talk. Also, when you join the node, please listen 10-15 seconds before transmitting. The cross band repeater is also used for our tracking and recovery team.

1622. New flight computer?

Just some comments after a quick read of the manual, no hands-on
experience.....

Serial data handling is a byte at a time, in and out. Can't simply
monitor a serial line and stuff a 4-digit number into a word, etc.

No other protocols such as SPI/I2C to talk to external devices (yet).

Fairly limited command set in general.

It has promise, but I wouldn't switch from a BS2p at it is now.

That's my take on it too. The hardware is pretty capable but the language doesn't appear to have any string handling capability. I wish it did because the serial interrupt cabability and the realtime clock would be great. For me though, byte-banging strings is just too gruesome.

I'm considering using a combination of a BS2 and a Palm IIIxe with one of serveral BASIC interpreters. With 8 meg ram in the PALM you can store a lot of data, have some reasonably sized programs and leave the device control to the BS2. A Palm IIIxe is about $25-$40 on ebay. You can get refurbs with warranties for $69. A BS2 oem is $30 from Parallax . The BASIC interpreter for the Palm is anywhere from free to $200. So if its possible to put together a pretty flexible system for $55-$90 range. Of course you still would have to add the ADC. (MELD has one that will talk directly to the Palm)

Another alternative we're looking at is a Linux based computer. I'm looking at GumStix(tm) (www.gumstix.com and www.gumstix.org) which is a complete Linux computer the size of a memory stick. Another member is looking at an ARM based kit for about $125.

I know this is a question difficult to impossible to answer totally completely, but could you give a more embellished idea of what kinds of things you'd be doing in BASIC on the PALM?

You're going to throw in parameters to the PALM through a serial port connection to the BS2, right? How easy or ugly does that get in terms of getting the stuff into the PALM and its BASIC?

> Another alternative we're looking at is a Linux based
> computer. I'm looking at GumStix(tm) (www.gumstix.com
> and www.gumstix.org) which is a complete Linux

I could look this up, but for expedience what is the current draw for the Gum Stick and the previously mentioned Internet ready computer on a board? Some of these high bells and whistles content machines can be awful power hogs.

Yahoo group: GPSL (2002 — 2008)
Date: 2005-08-24 20:08:28 UTC
From: Troy Campbell
Topic: 1622 Message: 1627

Hank,

You're right in that pushing everything into the palm through one serial port would be a pain. RS-232 does not lend itself to bus type operations. (One of the reasons I'm looking at the linux stuff is they have two ports.)

A little background: We've been using the Palm as a 'data logger'. We have a KPC3+ with a Garmin GPS35pc hooked to the 'GPS' port. We left the "MON" command on and connected the Palm to the DB-25 on the KPC. So we get everything it sent (including other balloons and the ground teams). We didn't have any software, we just used a free terminal emulator (AccessIt) and turned on the 'capture log'. When we recover the payload, we sync the Palm to a laptop and I wrote a perl script that picks the TNC/APRS entries out of the capture log DB. (It's not pretty but it cost zero dollars.)

This seems in-elegant so I thought "I'll write a data logger". A friend was using the MELD stuff (and flying it in our space-frame) so I checked it out. Turns out that the initial MELD software was written in BASIC. I googled around for 'BASIC on PALM' and came up with 3-4 interpreters. Probably the best compromise is HotPaw for about $18 (where do they come up with these names?) [Just FYI, there's an interpreter called 'smallBasic' that's free and 'cross-platform'. It runs on Macs, Linux and Palm. It has a couple of file handling limitations I don't like though, mostly due to the lack of file structure on the Palm]

Now I'm thinking, "I can do a lot more that just record data with this thing now!" But the only IO the Palm has (besides the infrared port) is one serial port. Bummer.

So now I remember a block diagram that Paul Verhage did a long time ago that showed a BS2 gating the serial output of the GPS between itself an the TNC and had an "Oh Yeah" moment. I'll use the BS2 to collect and control devices and to either 'feedthru' serial data to the Palm or to switch input lines to Palm when

needed (or commanded by the palm).

Now the Palm can be freed up for scheduling,
recording, and general high level stuff (an
abbreviated 'satellite O/S') and let the BS2 do the
lower 'driver' level stuff.

It's ugly okay, but it's pretty much 'how things work'
in 'real computers' and once the initial software is
written, you can change the whole complexion of a
mission just with software changes.

Sorry to be so long winded.

On the power consumption for the linux stuff, both are
using ARM processors that are 3.3v . We've just
started seriously thinking about them so I don't have
current consumption on the tip of my tongue
(er-fingers), but the gumstix is supposed to work with
4 double AAs for a long time. I just don't know what
they mean by "long".

I guess I didn't really answer another one.

"What would I do in the Palm?"

Basically (ha!) I'd make decisions that would require
way more logic than there is program-space in a BS/2.
It would get a lot easier to take actions based on
altitude, commands from the ground, internal timers,
external interrupts, etc. I'd think about scripting
flight phases, small behavior objects. You can change
the behavior and outcome of the mission or next phase
of the mission depending on realtime data. The BS/2
doesn't have the horsepower for that. [Though I've
seen extremely clever solutions with it.]

Okay, now I'm really done.

power requirements

ARM board at
"full speed" ---- 5V DC @ 375mA (first class power hog;
5 oink rating)

Gum Stick "Way Small" ---- unknown after minutes of searching
and consulting the Tiki(wiki);
website in running for most
infuriating "technical" website
of 2005 (suspected power hog)
Internet ready
computer board ---- haven't checked yet

N1LTV definition of power hog for computers this capable:
over 100 milliamps for sure; 50 - 100 mills is borderline hog.

Under 50 is nice; under 20 is first class.

The problem is these designers (seemingly) don't have power
consumption even on their radars.

1631. GPSL 2005 landing site map

Yahoo group: GPSL (2002 — 2008)
Date: 2005-08-24 23:45:19 UTC
From: Mark Conner
Topic: 1631 Message: 1631
Attachments: 2 described; binary payloads are missing from this source WARC

Attached is a GIF and a SA9 file showing the locations of all the landing sites for GPSL 2005. The MECSAT location is marked as approximate, but should be accurate to within a few hundred feet - I used the last posit available from aprsworld.net which was at about 100-200 ft AGL.

For reference, the distance between Hwy 48 and US 71 is 7.8 miles.

Files also available on the yahoogroups site.

Still not too late to contribute photos or video to the GPSL 2005 compilation! I'm still awaiting a video from EOSS.

Hi Mark,

Hey, thanks for that summary map! I guess EOSS won the non-existent
range contest :=}.

And thanks for the reminder to get that CD off to you. I hope you're
not too depressed at how noisy the sig was -- Chris KB0YRZ had
a casulty with his elevation rotator just prior to GPSL, so was unable
to peak up the sigs. ANd there wasn't much from the WB8ELK ATV after
launch - maybe some P2-3 stuff.

I'll get that off to you this week - for sure!

Mark,

I thought I'd posted the track file but must have
missed it. Anyway CAPNSPACE (KC0MIC) landing was at
41 09.4007,N by 95 01.9547 W
Burst was 95,082 ft

1637. Fw: NASA ANNOUNCES NAME CHANGE FOR BALLOON FACILITY

Yahoo group: GPSL (2002 — 2008)
Date: 2005-08-25 14:13:15 UTC
From: Ralph Wallio, W0RPK
Topic: 1637 Message: 1637

----- Original Message -----
From: <NASANews@...>
To: <undisclosed-recipients:>
Sent: Thursday, August 25, 2005 8:30 AM
Subject: NASA ANNOUNCES NAME CHANGE FOR BALLOON FACILITY

Dolores Beasley/Erica Hupp
Headquarters, Washington August 25, 2005
(Phone: 202/358-1753/1237)

Betty Flowers
Wallops Flight Facility, Va.
(Phone: 757/824-1584)

RELEASE: 05-234

NASA ANNOUNCES NAME CHANGE FOR BALLOON FACILITY

NASA has officially changed the name of the National Scientific Balloon Facility (NSBF) in Palestine, Texas to the Columbia Scientific Balloon Facility.

Rep. Jeb Hensarling, (R-Texas) proposed the name change to the House Committee on Science on April 26, 2005, as a reminder of what the crew of the Space Shuttle Columbia stood for: honor, bravery and the quest for knowledge for generations to come.

"This tribute to the crew of the Space Shuttle Columbia is in recognition of the dedication and sacrifice made by those brave individuals willing to risk their lives to further humanity's knowledge about space exploration," said Vernon Jones, NASA's senior scientist for suborbital research at NASA's Science Mission Directorate, which manages the facility.

On February 1, 2003, the Columbia and crew were lost over the western United States during re-entry into Earth's atmosphere. The 28th and final flight of Columbia (STS-107) was a 16-day mission dedicated to research in physical, life and space sciences.

The Balloon Facility was established in 1961 by the National Science Foundation in Boulder, Colo. The facility was moved to Palestine in 1963 and was formally named the National Scientific Balloon Facility in January 1973.

In 1982, sponsorship of the NSBF was transferred to NASA. In October 1987, NASA awarded a contract to New Mexico State University's Physical Science Laboratory, Las Cruces, N.M., to provide engineering and launch support for the agency's Scientific Balloon Program and for oversight of NSBF operations.

The NSBF provides complete balloon operation services and engineering support to the scientific community in the United States and several foreign countries. Operation services include inflating and launching the balloon, tracking and recovery of the payload, tele-command and data retrieval. Engineering support includes design of balloon systems, research in balloon materials, and electronics' design.

The facility has launched more than 1,700 balloons for 35 universities, 23 research agencies, and 33 foreign groups. Payloads up to 5,000 pounds are routinely flown on balloons of up to 40 million cubic feet in volume at altitudes exceeding 70 miles. Flight time varies from several hours to several weeks. Seventy-four on-site contract employees work at the facility and support NASA's international balloon operations.

NASA's Goddard Space Flight Center's Wallops Flight Facility, Wallops Island, Va., manages the scientific balloon program for the agency's Science Mission Directorate.

1638. Re: [GPSL] GPSL 2005 landing site map

Yahoo group: GPSL (2002 — 2008)
Date: 2005-08-25 14:16:18 UTC
From: Mark Garrett
Topic: 1631 Message: 1638
Attachments: 1 described; binary payloads are missing from this source WARC

Bill was going to launch two balloons but since things were running extremely late for us getting one balloon going, Bill used some Wal-Mart twine to attach the payload from the second balloon to the first. The twine that was attached at the CW beacon's dowel rod to form the antenna had put excess stress of the twine at the tip of the rod, separated the beacon and a GPS package sometime after burst. The now two payloads landed 6 miles apart with the GPS and CW beacon not having benefit of a parachute but landed with no damage. We could only speculate that somehow the two packages interacted in such a way that it spun down, slowing the decent. We knew something was up when I was monitoring the CW beacon and was getting a heading of a package on the ground and Bill got his batteries changed on his ATV receiver in time and noted that the ATV package was still up in the air with a completely different GPS heading. We noted where I heard the CW beacon and chased after the ATV package recovering it first and then going back and recovering the second, separated payload.

So you didn't read Bill Brown's post.? His APRS payload separated from the main payload right around burst.? The APRS payload had a free fall into the corn field (where else of course).

ARM board at
"full speed" ---- 5V DC @ 375mA

RVHE Internet ready
computer board
(http://www.rvhe.com/) ---- 5V @ 500 milliamps
(info provided by a designer
of the RVHE)

Still need to get the spec for Gum Stick "Way Small"
since this is another company that doesn't seem to publish
the characteristic.

I'm going to speak further to RVHE about the current drain
issue since it's possible to get the drain down to a few
milliamps with a slower clock, as is characteristic of all
CMOS logic.

If these people know there's an interest and a consumer
demand for a simple variation of the product, it might
happen. Lacking the feedback, it probably won't happen.

Just the fact that these current drains for two of the three
products are not published says a lot. I have several apps
that need to run on 100% solar power (or *small* battery power
for at least 6 months), so these products cut themselves out
of the running right off the bat.

Hank

1643. Flight success again!

Yahoo group: GPSL (2002 — 2008)
Date: 2005-08-28 23:21:18 UTC
From: Don KA0JLF
Topic: 1643 Message: 1643

I saw 86,162 on findu. That is higher than two weeks ago, same size balloon, full tank, more payload weight, go figure.

K0NMS-11>APT311,SKYLAB,WIDE2-2,qAR,KA2FNK:/162346h3849.84N/09446.72WO281/014/A=086162

But it was fun. I got to see it land, but couldn't get the camera turned on in time to take a picture, what a sight. Of course the DV-5900 ran out of memory. Just before the landing I think (at least 5 minutes too much messing around before launch - 20 minutes of on ground prep recorded). Recorded 2:26:46 time, 1023MB (a full GB). This time I put a receiver near the DVR mic, and recorded the APRS posts on the DVR audio. Now to see if it decodes. I meant to do the same with the Simplex Repeater audio but forgot to put the second receiver in. Oh well there's always next time.

Hope to post some photos to the web soon. We watched much of the video at lunch.

73 thanks to ALL!! Enjoyed hearing the simplex repeater being used. First time in a long time to talk to some friends on the radio (no ones fault but mine).

1644. 1. Flight success again!

Yahoo group: GPSL (2002 — 2008)
Date: 2005-08-29 19:59:00 UTC
From: K. Mark Caviezel
Topic: 1644 Message: 1644

Don:
Congrats on your flight, and viewing the landing.
That's always a kick.
As many latex balloon flights as I pay attention to, I figure a possible +/- 10,000 feet tolerance for actual burst altitude versus predicted. That's a completely unscientific analysis but does well to account for the many variables of
actual fill volume versus planned,
manufacturing variability, and
effect of pre launch stresses for gusty lousy conditions or complete dead calm.

So, more payload achieving a higher burst between two flights doesn't surprise me if the difference isn't too huge. I think, but I am not certain, that lightly filled balloons (~5% free lift, slow ascent rate) have actually done worse than normal balloons (10-15% free lift, ~1000 foot per minute ascent rate), a result incongruous with burst diameter, but attributed to UV degradation or load over time.

1645. UV degradation of latex (?)

Yahoo group: GPSL (2002 — 2008)
Date: 2005-08-29 22:19:54 UTC
From: n9xtn@cox.net
Topic: 1645 Message: 1645

This has been discussed as a possible failure mode for latex balloons. I'm not sure it's anything but speculation, especially at the time scales we're dealing with (1-8 hours).

It would be interesting to blow up a set of inexpensive latex balloons (PIBALs?) to near the max diameter, leave half outside exposed to full sun and the other half inside, and see who pops first. This would require a quiet and sunny day so wind stresses don't compromise the results.

I don't think we can cheaply prove that UV degradation causes balloon failures at altitude, but this simple experiment might provide a little weight one way or the other.

73 de Mark N9XTN

1646. Re: [GPSL] UV degradation of latex (?)

Yahoo group: GPSL (2002 — 2008)
Date: 2005-08-30 00:13:20 UTC
From: Mike Manes
Topic: 1645 Message: 1646

I think that UV degradation of latex (thru lysing of elastomer bonds) is already a proven phenomenon. This is why latex balloons are shipped in opaque containers. I've seen the effects of exposure on balloons stored in normal fluorescent room lighting with the container "cracked"; almost like photographic film! The exposed latex becomes markedly darker. Does it also become weaker? Dunno. But it probably loses elasticity.

Whether this process occurs fast enough to affect burst altitude as a function of ascent time is the root question here. And yes, it remains a hypothesis, right alongside the one that suggests micro-meteor impact as a causative factor.

Note that solar UV intensity is much greater in the stratosphere than on the surface - heck, it's even greater on the deck in Colorado than down in the flatlands! And simple outdoor exposure invites not only the uncontrolled variable of wind, but also of the diurnal solar cycle and intermittent cloud cover.

So perhaps a more controlled, and possibly faster, experiment would utilize "black lights" or a tanning booth as the UV source, with measured intensity equivlalent to earth normal at, say, 100 mbar (50K'). This would still require quite a few samples to deal with manufacturing variations.

Despite the dearth of published studies in this field, it might be worth a literature search to see if this wheel's already been invented. Anyone have access to a good academic database that might brush on this field?

Not sure whether UV degradation had any effect on our floater flights in December 2004 but here's some details of the 4 flights:

All four floater flights were pretty much as follows:

Scientific Sales 1500 gram balloon (Sept 2004 batch)
1.5 lb flight train
1.75 to 2.50 lb nozzle lift

Ascent rates from 275 to 400 ft/min

The December 4th flight was launched in the morning - 400 ft/min ascent rate....it achieved float for just 2 hours before bursting in mid afternoon.

Flights 2 and 3 in Dec. 18th were launched around 1:00 pm or so....and never achieved maximum altitude before losing sunlight....they levelled off at 98 and 105k ft.....one was heard again the next morning near Nova Scotia and apparently burst 3 hours after sunrise after 22 hours in the air....it had apparently been slowly descending during the night since that's the only way it could've hit winds that would put it in New England..... 275ft/min and 350 ft/min for the seperate balloons.

Flight 4 on Dec 26th

Launched around 1:00 pm and reached maximum altitude in late afternoon before sunset....batteries froze out after sunset after a few hours of float on it's way to the Bermuda Triangle.

Perhaps a series of identical floater flights both during the day and some during night would answer the UV question.

- Bill WB8ELK

I'm going to try an intentional floater flight soon using these same conditions from the same batch of balloons...perhaps this weekend.

Date: 2005-09-03 19:50:33 UTC
From: Mark Conner
Topic: 1653 Message: 1653

I am looking for a 6-cell AA battery holder (cells wired in series) that perhaps someone has in their parts bin. I'm looking to use this for a power supply for the NSTAR backup beacon. It's about the only part I need right now, so I'd rather not spend so much on shipping from the usual supply sources. If you happen to have one, perhaps we can work out cash or a trade in other parts.

Mark,

Would this work for you:

http://www.kd7lmo.net/tech_pwrsource_l91_8pack.html

It is 8 cells, but I could convert it to 6 cells. This is a prototype of
a design that I rolled using a PCB house. Heavy duty Keystone AA battery
holders with real spring steel clips instead of thin wire springs.

The price is right, nothing.

Let me know

1655. Re: Suggestion

Yahoo group: GPSL (2002 — 2008)
Date: 2005-09-05 15:30:25 UTC
From: Ralph Wallio, W0RPK
Topic: 1655 Message: 1655

Stephanie,

I have very little time for Ham Radio this long weekend but I have been thinking about your suggestion. My opinion is that high altitude ballooning is a very small part of Amateur Radio and that the probability that we could cause an interference problem approaches zero.

In this age of cellular telephones and ubiquitous internet access the opportunity for Hams to provide the only reliable communications is very short and the current communications emergency is almost over. Portable cellular telephone and Wi-Fi nodes are being placed and fired up by the score. It appears the value of Ham Radio communications will be over before we are allowed to even enter the affected areas.

Ham Radio communications will find a few important niches to be of continuing value for a while longer. Continuing operations will be managed by the ARRL Field Organization, specifically ARES. The ARRL will handle any clear channel requirements including posting specific frequencies at http://www.arrl.org/ and even asking the FCC to require all other Hams to stay off specific frequencies.

Like all active Hams we should watch ARRL web pages for announcements relating to staying off specific frequencies such as what is posted at http://www.arrl.org/news/stories/2005/09/01/2/?nc=1 (all HF for now).

We can consider canceling our high altitude balloon flights when the ARRL starts canceling scheduled HF and VHF/UHF contests, QSO parties, et al. Until then I suggest we should continue flying.

Subject: Suggestion

Hi Ralph,

As a police officer I am very concerned with the possible effects of our hobby activities on what is going on on the Gulf Coast. Could you facilitate a discussion among the ballooning groups regarding an effort to avoid any chance of interference with rescue/recovery operations on

APRS in the Hurricane Katrina area? I think that you would be the best person to spur this discussion.

I would suggest that all groups make sure that their flights not do anything to interfere with those efforts. If you must fly use a maximum path of WIDE2-1 and certainly no RELAY, WIDE, or WIDEn-N in excess of 2-1.

I would also suggest that every group take the equivalent monies spent on a flight and donate that to one of the groups providing humanitarian efforts in that region.

Actually, this would be a good way to demonstrate effectively that balloons can help tremendously with emergency comms over a very wide area. One of the reported problems with keeping order and coordinating rescue in the stricken areas was the total lack of comms that police and rescue workers reported between each other and command centers. When the cell and communications towers have been compromised, total comms blackout seems to be the result.

We can help tremendously by flying cross-band and simplex repeaters on low ascent rate latex balloons (another good reason to perfect a balloon valve) to achieve maximum duration, Solar Montgolfiere balloons or even zero pressure...Just by providing a few hours of multi-state VHF/UHF comms between field workers using just HT's and disaster centers up to hundreds of miles away would be of tremendous help....this could even help with comms across the local area as well.

If it weren't for the rapidly declining health of my girlfriend which requires me to stay near home, I'd be in Mobile, AL right now sending balloons west over the area to help out (since we're nearing turnaround....stratospheric winds are getting lighter but still out of the East and would allow very long duration flights that will keep in range).

My suggestion is that those balloon groups with the resources keep a crossband repeater or simplex repeater at the ready along with a long duration balloon for emergencies....and coordinate with the ARES groups in your region on how to coordinate an effort such as this with their disaster comms. Something to keep in mind.

- Bill WB8ELK

1657. Re: [GPSL] Re: Suggestion

From: Zack Clobes
Topic: 1655 Message: 1657

I think there is a certain amount of potential there, but on the other hand, that would be a very expensive means of putting a single repeater on the air for a finite amount of time.

The other thing to keep in mind was that the ARRL was requesting the amateurs not enter the disaster area until after the danger was gone.

"I know many people would like to move now," [ARRL President] Haynie said. "Please don't. I know many of you want to enter the fray, come to the coast and get involved. Please, not yet." Haynie instead advised hams eager to assist to make sure they're prepared, refresh their skills and knowledge of protocols and procedures.

This was sent in a ARRL Letter on Friday four days after the hurricane hit.

Hi Ralph,

I too have little time for Ham Radio right now. I am trying to organize a law enforcement response from Idaho to the affected area for both manpower and equipment. 200 New Orleans Officers walked off the job since the hurricane, two Officers have committed suicide, and countless other Officers and Deputies are still in the same clothes that they went to work in on Sunday August 28th and catch what little sleep they are getting in the seat of a car. They have no more homes, they have no uniforms or other clothes, and some have no more families, but most continue to do their job with no communications and very little equipment.

I can assure you that cell phones and the Internet are of little to no use to the rescue personnel even now after 8 days to the area. Same goes for land telephones, then virtually don't exist either.

Ham radio is still playing a large role in what little comms they have and I again would encourage everyone who is PLAYING with ham radio to make every effort to make sure that your PLAY does not interfer with the critical communication needs in the Gulf Coast area and for about 200 miles inland from the disaster area.

For APRS you can best do this by keeping your paths short (WIDE2-1 is best) and NOT overfly the area with any type of equipment. The last thing the disaster service personnel need is a hobby balloon getting in the way of what they are doing and/or someone's idea of a "good idea" getting dropped on someone's head. What they truly need are reliable, 24/7 communications of any type and unfortunately even ham radio has been able to afford them little of that due to a lack of preparation on the part of the area hams, and the disaster coordinators that hooked their communications wagons to cell phones and the Internet.

I suggest that waiting until the ARRL makes some announcement is foolish knowing what is known by persons on the ground there NOW. This emergency is not being managed at this point by any centralized organization but instead by people who are trying to make do with very little. I'm not suggesting that anyone not fly, I'm just suggesting that we stay away from the disaster area with our toys and our misguided good intentions. Of course I also suggested that the cost of one flight be donated to a charity of your choice to help with relief efforts in the area.

1661. GPSL 2006 Dates in Hutchinson

Yahoo group: GPSL (2002 — 2008)
Date: 2005-09-07 02:08:50 UTC
From: Zack Clobes
Topic: 1661 Message: 1661

I believe that I already announced that the Fourth of July (and 8 July) will not be an option for GPSL in Hutchinson, KS next year because of the US Senior Open golf tournament.. Does anyone else have any other preferences?

At this point, my schedule is fairly open. I have had a couple of requests that we do not do it in the weeks leading up to the 4th because of harvest in the area.

Thoughts?

Zack Clobes, W0ZC

FYI...
I hope to get the IS DV camcorder tonight, so this
Saturday's flight should have 2 DV camcorders. One
looking up, one looking out and down a little.

I hope to capture audio from the simplex repeater this
time in addition to the APRS audio.

Hi Zack,

I recall your having mentioned the US Open, but at the time, the dates were uncertain. How about 1 July 06? I think working this event around a national holiday will help attendance overall. How would harvest and GPSL interact?

Colo Space Grant has requested EOSS flights on 4/22, 6/17, 7/15 and 7/29/06. EOSS members are also committed to other events on 6/10 (ARRL HamCon) and 6/24 (FD). Other public service events are likely to conflict in Jun & Jul, but dates are as yet TBD.

1668. Balloon flight 9/10/05 Herrington, KS 9 a.m. HELP with FREQUENCIES???

Yahoo group: GPSL (2002 — 2008)
Date: 2005-09-08 00:52:22 UTC
From: Don KA0JLF
Topic: 1668 Message: 1668

After seeing a post in a group, it made me think about what frequencies are in use now, with the disaster work?

We were asked to fly a balloon again this year at the Herrington Airports Open House. We have been doing this each year we can since the first GPSL.

I plan to fly a minimal payload. We plan APRS on 144.34, and a simplex repeater on 145.555. Does anyone know if anyone in our footprint (about 500 mile radius from central KS) will be using these frequencies?

I posted a short video of our last flights balloon burst at:
http://www.habitatskylab.org/HS05C/ if you care to view it. IT was done on my lunch hour. IT is my first one. New OS, new software and a learning curve.

Thanks for any help you can give on the choice of frequencies.

Thanks,
Don KA0JLF

1669. Balloon flight 9/10/05 Herrington, KS 9am

Yahoo group: GPSL (2002 — 2008)
Date: 2005-09-08 18:07:35 UTC
From: K. Mark Caviezel
Topic: 1669 Message: 1669

Don:
your burst video was really cool!
RE balloon flight xmissions affecting Katrina relief:
my suggestion- beacon only once a minute, or once every two minutes to make your QRM -if any- vanishingly small. There is a single, high digi in NOLA that is still working, according to what I've seen on the TAPR APRS list. That is on 144.39, and I'd imagine that emergency responders would stick to the normal APRS frequency to take advantage of that infrastructure.
Simplex repeater- if any emergency responders are using 145.555, you'll hear them and can stand down on your transmissions until the balloon RF footprint does not include the disaster region.

And, here is what I found on ARRL.org:

Amateur Community Asked to Give Katrina Emergency Nets Clear Frequencies (Sep 5, 2005) -- Several HF nets continue in operation to support Amateur Radio's response to the Hurricane Katrina emergency. ARRL asks all members of the Amateur Radio community who are not taking part in disaster relief or recovery operations to give these nets as much elbow room as possible--5 kHz or more on either side of the net frequency. Nets already are having to deal with less-than-ideal propagation, and any interference--even if it's unintentional--can make their job all the more difficult. Special Counsel Riley Hollingsworth of the FCC's Enforcement Bureau says the FCC has not issued an Emergency Communication Declaration (ECD) for any emergency net frequency.

Just to set up a strawman, how about 4-6 August (Fri-Sun)? That should be far enough after the 4th that most people can comfortably take a day or two off, gets away from the wheat harvest and the golf tournament, and is a hole in EOSS's otherwise busy flight schedule.

1674. Multiple Failures on ARSAT 2005D

Yahoo group: GPSL (2002 — 2008)
Date: 2005-09-11 02:01:11 UTC
From: Paulus Adisoemarta
Topic: 1674 Message: 1674

What to do if beacon payload, APRS payload and Telemetry payload failed?
Revert to visual.

This what had happened this morning on ARSAT balloon 2005D.

The CW beacon failed at launch time, thus no beacon and pictures
from digital camera.
But we still have APRS (PocketTracker and OpenTracker using telemetry
firmware) and also 915 MHz telemetry.

Well, after 90 minutes APRS failed at 33,662 feet (both tracker,
as I use only 1 radio, the PocketTracker radio).
See on findu.com: KE5BFH-11 is the PocketTracker and N5SNN-11 is
the OpenTracker with telemetery mode.

But the 915 MHz telemetry continues to work (this is basically a serial
extender using 915 MHz spread spectrum radio), till burst.

We had visual at 73,000 feet (6 people were able to see it), then
another visual at 93,000 till balloon burst at 97800 feet (the sky was
cloudless that we can see the talc spread out at burst). Plain eyes
without binoculars.

But then the 915 MHz radio failed at 70,000 feet while descending.
With no beacon, no APRS and no telemetry we revert to visual.
Basically we box the approximate landing site and just scan around
for visual sight of the parachute. We didn't see the balloon
till the predicted touchdown time, so we are afraid that we might
already lost the flight train.

Fortunately the Pockettracker came to alive after touchdown, and we use
it as a beacon for DF until we got one solid packet with its location.
The OpenTracker never came to alive again after touchdown.

Lift off at 10 AM CDT, landing appx at 2 PM and recovery at
around 3 PM. Landing site is 62 miles downrange.

Now back to the drawing board to figure out the failures.

We did not accomplish the 100,000 feet objective, but came very close.

1675. HiBall-4 has been recovered from the middle of the Tennessee River

Yahoo group: GPSL (2002 — 2008)
Date: 2005-09-12 05:13:56 UTC
From: wb8elk@aol.com
Topic: 1675 Message: 1675

On Sunday Tim Reliford, a bass fisherman from Somerville, found HiBall-4 in the middle of an inlet about 1/2 mile upriver from where it splashed down a week ago in the Tennessee River just south of Huntsville, AL... it was almost to Ditto Landing on the side across from Hobb's Island...it was hung up in some branches in a shallow spot in the middle of an inlet near where UAH launches their rowboats and where this fellow puts in his bass boat.

It's full of river water and all the components in the PocketTracker are corroded green but I think that the Garmin will work since it's waterproofed. The parachute and balloon remnants were not attached and it looked like a boat prop had sliced the rope just above my beacon.

1676. HABITAT SkyLab HS05D flight a success!

Yahoo group: GPSL (2002 — 2008)
Date: 2005-09-12 12:39:35 UTC
From: Don KA0JLF
Topic: 1675 Message: 1676

Flight info, video of balloon burst, xls file of
flight data with graphs at:

http://www.habitatskylab.org/HS05D/

First slideshow of pics, link at:
http://www.habitatskylab.org

Another slideshow will be added tonight with photos
from Debbie and Kent. I'll add links to the slideshows
to the HS05D page.

A link to a google map, with sat foto on one of the
pages, I think. IF not I'll add later.

More info to follow,
Don

Hi Paulus,

Kinda sounds like a low-temperature problem. What chemistry batteries were being used? (LiSO2 are the low-temp survivors). Did you run a cold soak test on the modules before first flight? An hour in a beer cooler with a lb or so of dry ice will be worse than worst case.

Mike, the battery was Eveready e2 Lithium, and it is rated to -40C,
so the battery should be Ok.
The problem was on the radio (PocketTracker), somehow when I reopened
the package the morning of the flight to reflash the OpenTracker, due
to a bug in the telemetry firmware, I didn't put back the insulation properly
such that the Altoids tin can of the PocketTracker touched the inside
of the mailing tube.
Thus slowly the radio got colder and finally quit. But when it got
heated again after touchdown it transmit again.

The moral of the story, do not work on the payload the morning before
the flight, as you'll mess up something else.

Note: the APRS payload is a tandem OpenTracker and PocketTracker together
where OT is using PT's radio, with different slottime (to prevent
simultaneous transmission).

But, we're happy with the performance and persistance of the students,
they didn't give up even having total loss of downlink.

Thanks,

Paulus N5SNN

1679. Re: [GPSL] Multiple Failures on ARSAT 2005D

Yahoo group: GPSL (2002 — 2008)
Date: 2005-09-13 19:15:31 UTC
From: Mike Manes
Topic: 1674 Message: 1679

Hi Paulus,

Still sounds like a low temperature problem. One of the PT's salient
feratures is is very low power consumption, which translates 2 ways:

1. Very long battery life, and
2. Very low local heat generation.

For a balloon payload, #2 can be a disadvangtage, especially if there
is very little thermal insulation between the payload guts and the
forced convection of air down to -80C outside. It is also known that
the VCO free-run freq in the PT xmtr is not temperature-stable; this is
why the PLL tuning procedure is different for balloon payloads. If the
VCO free-run freq drifts too far, the PLL can't pull it in, and the
xmtr goes QRT. Although other balloon groups have had good results
with the PT, EOSS has tested one on 3 flights, and each time, the beacon
failed above about 40K ft in ascent.

Suggest enclosing the PT in at least 1" thick styrofoam with tight
seams, and perhaps even including a chemical glove warmer - one which
carries its own oxidizer rather than depending on ambient PO2. Since
you're using the OT for beacon generation, you might consider adding an
internal temp sensor to one of the telemetry channels, or carrying an
Onset Hobo to log temps in flight.

1682. Fw: HABET FAA Requirements

Yahoo group: GPSL (2002 — 2008)
Date: 2005-09-19 15:06:02 UTC
From: Ralph Wallio, W0RPK
Topic: 1682 Message: 1682

You folks may be interested in current relationship issues between ISU HABET and the FAA. Comments, concerns, insight and suggestions will help. I will forward responses to ISU. Note that what Minneapolis ARTCC has to say may equally apply to NSTAR, CNNSP, UND and Concordia flights.

Three e-mail discussions attached:

Colt (ISU HABET) to me
Colt to Ed Mills (FAA Minneapolis ARTCC)
Ed Mills to Colt

EOSS maintains a close relationship with the FAA and occasionally change their flight schedules when requested (required?) by the FAA. Most/all other groups either do not notify the FAA in any way (for exempt flights) or just file NOTAMS with Flight Service.

I wonder if the FAA understands the growing magnitude of ARHAB flights(?) I wonder how Minneapolis ARTCC would react to news that there are many more ARHAB flights in their airspace than just ISU HABET(?). Are we approaching a new era of much more demanding ARHAB flight regulation(?)

1683. Re: [GPSL] Fw: HABET FAA Requirements

Yahoo group: GPSL (2002 — 2008)
Date: 2005-09-19 16:22:09 UTC
From: Kent Ochs
Topic: 1682 Message: 1683

My experience with model rocketry concerning notification and waivers has been that FAA officials rarely understand their own regulations. Ask two FAA officials the same question and you will get two different answers.

I certainly feel that cooperation, in the name of safety, is a good thing. But, the model rocket hobbyist's attempt at cooperation resulted in a multi-year fight with the FAA to get them to follow their own regulations. This legal action was led by a fairly large group, the NAR (National Association of Rocketry). This group spent considerable dollars in this fight. I do not believe that this hobby has a group similar to the NAR to lead the fight, unless the ARRL is interested.

A couple of suggestions in no particular order

1. The ARRL does have attorney members that provide pro bono services in Amateur Radio related legal matter. I do not know whether this would applies to ARHAB as this is problem is FAA rather FCC related.

2. If a flight requires a waiver, you may have no choice but to do your best to develop a working relationship with the FAA within the rules that govern balloon flights. No where in those regulations do I remember transponders being required. Keep in mind that government agencies are forbidden to make up regulations without going through a formal process to do so.

3. I would be careful about debating this issue in public. Public official have and will read these kind of posts. The possibility exists that something said here will be taken out of context or will be viewed as offensive. From a legal standpoint, you may tip your hand. This could be counter productive to the cause. Of course, to some extent, I am violating this point by writing this message:-(

4. Unless your payload requires a waive, file your NOTAM and leave sleeping dogs lie.

Living in the Chicago area, I would never dream of launching a balloon, exempt or not, in the busy airspace around O'hare. I am all for safety. I also believe in following the rules as written and not allowing unreasonable government requests and regulation outside what is written. If the FAA is going to try to enforce or apply a different set of regulations on this hobby, then they need to go through the proper process.

Good luck to all concerned in this matter. For your and the hobby's sake, I hope a reasonable resolution to this issue can be obtained.

>4. Unless your payload requires a waive[r], file your NOTAM and leave
sleeping dogs lie.

I'll give that one a loud "AMEN"... How many exempt balloons does NWS
launch every day?? We're deluding ourselves if we think that the
comparatively small number of amateur balloons flying each year are
significant in even a statistical sense when it comes to air safety.

Want more regulations? Just let all of the amateur groups around the
country start creating a hassle for their local ATC about otherwise exempt
flights and watch what happens within a few years...

...and if we were all to find a lightweight and affordable way of
implementing a Mode C transponder into our payloads, I'm just sure
the FAA would relieve us of all responsibility if an incident were to
occur!

I'm not sure what the answer is. I'd hate to think we're just
getting started in this hobby and might be forced to shut it down.

Kent,

I live in Rockford, IL, and have talked to the FAA about balloon launches as I thought that we are close enough that it would be a problem. It took a while to get a response, but they called one day and said OK. That was a few years ago and never got enough guys (or girls) together to make it happen, but still would like to at some point.

So, let's get some people together and launch from Rockford?

Living in the Chicago area, I would never dream of launching a balloon, exempt or not, in the busy airspace around O'hare. I am all for safety. I also believe in following the rules as written and not allowing unreasonable government requests and regulation outside what is written. If the FAA is going to try to enforce or apply a different set of regulations on this hobby, then they need to go through the proper process.

Good luck to all concerned in this matter. For your and the hobby's sake, I hope a reasonable resolution to this issue can be obtained.

1688. 100g balloons for sale

Yahoo group: GPSL (2002 — 2008)
Date: 2005-09-19 22:31:06 UTC
From: Mark Conner
Topic: 1688 Message: 1688

I recently received a batch of 30 100g balloons from an eBay seller. They are Kaysam balloons and were manufactured in November of 1995. They are all sealed and don't look like they have any significant degradation. I think they were kept in the original box from Kaysam during storage.

They are the usual tan latex color. I got these for demos, PIBALs (though color isn't optimum), experiments as "booster" balloons, and so forth. I'll keep a bunch for myself, but plan to sell at least 10 or 15 if anyone's interested. Cost will be $4 each which includes postage - some sort of quantity discount for >5 to one address can probably be arranged.

I guess if we held a super launch here in Rockford, IL, I would be able to go! Don't know if the "groups" would want to come here, but it is only 90 miles from downtown Chicago, 60 miles from Woodfield mall, where those that like to shop can do all they want! Not that Rockford doesn't have shopping of it's own.

If there is ever an interest to come here for a super launch, let me know.

I've always hoped we could have more than one super launch per year. Perhaps this could be the second. I imagine launching from your neck of the woods would help bring the New England states to a super launch.

We've have to pick a day that doesn't conflict with GPSL.

Or perhaps, we could hold GPSL in Rockford some year.

1693. Re: [GPSL] Fw: HABET FAA Requirements

Yahoo group: GPSL (2002 — 2008)
Date: 2005-09-22 02:57:49 UTC
From: Mike Manes
Topic: 1682 Message: 1693

Hi Folks,

I've been following the thread on the GPSL reflector that Ralph's email started with great interest. EOSS's relationship with Denver Center and DEN TRACON goes back to the early '90s, when we flew our first "heavy" for Univ. of Colorado.

Back then, the FAA was in the Commerce Dept. and charged with prompting commercial aviation, with flight safety as a primary means towards that end. Some of you may recall seeing the movie "The Great Waldo Pepper"; a side story in this flick was the birth of the FAA, prompted largely by some rather nasty accidents brought on by the barnstormers in the post WW1 era. So it's important to understand the point of view that the FAA folks see our balloon operations from: uncontrolled (and uncontrollable) incursions into controlled airspace, where every other flying object short of birds and lost party balloons shows up on an air traffic controller's scope.

Were it not for a further mandate to promote use of civil airspace for scientific and meteorological purposes, then the FAA would by all rights simply prohibit unmanned ballooning, period. Of course, that would put the hurts on the accurate weather data that the 120 some NWS RAOBs produce, as well as the research conducted by NASA, NOAA and NCAR. Accordingly, unmanned balloon ops are accommodated under the provisions of 14 CFR Part 101 (FAR 101), along with rockets, kites and tethered balloons.

Those of you who have attempted to read this somewhat arcane reg may have been left scratching heads about some of the provisions, e.g. trailing wire antennas and position reports only every 2 hrs. Even the requirement to carry a radar reflector is obsolescent, since few if any FAA control sites even look at primary returns any more. So far as I've been able to determine, it was last amended in the '70s, in reaction to some clown who lived under the approach corridor to LAX launching weather balloons in front of approaching aircraft. This was before GPS or even Loran C, and when FAA transponders and the batteries required to run them would have presented a greater risk of mid-air damage than they could be expected to avert.

It was also back when the amateur high altitude ballooning community comprised maybe just Ralph and Bill Brown. So there really hasn't been much incentive to update FAR 101 to reflect the technology that most of us use regularly, nor to redraft it in plain English!

The foregoing is intended to explain why it's so hard to find ANY FAA folks in the boroughs who understand that reg, even if they've

heard of it. And it also may explain why there is so much variability in how it's applied. I personally believe that an updated FAR 101, drafted with input from us in the community, would go a long way towards eliminating this spotty regulatory action and would further serve to encourage new balloon groups to get flying, since they would know exactly what's necessary to operate safely in civil airspace and further, how to do it. But that's a separate thread, I'm sure, and one which not all of us could easily come to a consensus on, either.

With that background out of the way, perhaps it would be helpful to understand the healthy working relationship that EOSS has established with the FAA over the past 14 years. It began with a face-to-face meeting with the Airways and Procedures manager at Denver ARTCC in Longmont CO.

This personal contact is critically important, in my view, in that it fosters some understanding that the issues relate not so much on chapter-and-verse regs, but on the mutual interests of both parties. Foremost of these is avoidance of a mid-air collision between an aircraft and one of our flight strings; there is no happy ending for either of us in such an event. In fact, absent that risk, we wouldn't be having this conversation.

Collision avoidance can be implemented only to a very limited degree by us balloon operators. Once the bird is launched, the only active control we have is to fire the cutdown. Of course, we can use BalloonTrack to pick a launch site that will minimally impact folks on the ground and to stay clear of airport traffic, and I expect that we all do that to the degree possible. But even if we could detect an impending mid-air, there's not much we could do independently to avoid it. That's where the FAA comes into the picture.

If the FAA controllers have a pretty accurate idea of where our flight string is, both geographically and in altitude, then they can steer the aircraft that they are controlling around us. And they generally give us at least a 5 mile and 3000 ft berth. But of course, that requires that they know where we are. That's where our duty begins.

If we were to carry FAA Mode C transponders, then we'd show up on the controllers scopes just like any other aircraft, with the only limitation being that they can't steer us or control our altitude. Not a real bind, however, since those sector controllers also know how to deal with non-conforming flight crews or those suffering radio failures. They also are trained to deal with transponder failures as well, but this is a bit tougher nut to crack. It usually involves calling for current VOR position fixes from the aircraft and plotting those on the face of the scope with a grease pencil.

Controllers can also direct the plane to take on a specific altitude, course and speed. This isn't an option for a balloon, but due to its zero lateral airspeed, it's essentially a stationary target, except for non-zero ascent and descent rates. Here's where our inflight reports

are useful, despite having to be "sneakernetted" from the floor supervisor to the sector controller.

The frequency and accuracy of those reports have improved stepwise in the past 15 years. In the early '90s, the EOSS tracking and recovery team took regular DF bearings from stations positioned around and at some distance from the balloon, and these were compiled to create a fix. This fix was called in to ARTCC or TRACON, but it was at least 5 minutes old by then. A few years later, first Loran C and then GPS beacons were developed, which provided much more timely reports, but which still had to be phoned in. Most recently, those GPS-based APRS beacons are now I-gated thru to findu.com, where they can be accessed by the FAA in their native language: VOR radial and range as well a altitude, on a minute-by-minute basis.

At each of these steps, EOSS was thanked by the FAA for making the controllers' jobs easier. In fact, after our first flight using findu web reports, the supervisor at Denver Center took the time to call us and tell us that this was absolutely the best reported balloon flight that he'd ever seen.

Not that they'd REALLY, REALLY prefer us to carry a transponder, however. That would make things as easy as possible, short of us simply not launching. One of the responses to this thread mentioned something about adding the 6-lb weight to the flight string would probably push all flights past the FAR 101.1 exempt limit. Not so, on two counts:

1. EOSS interprets "payload" to be that part of the flight string that is essential to the flight mission, regardless of the kind of airframe that gets it to altitude. Accordingly, we don't count the weight of the balloon, parachute or cutdown device in payload weight for FAR 101.1 purposes. And the same thinking should apply to an FAA transponder, IMHO; in fact, one could arguably delete the weight of the APRS beacon(s) as well, but we've not gone that far yet.

2. I have spec sheets on commercial Mode C transponders that weigh under 3 lb, without batteries. But they cost over 2 grand, and must be recertified annually. I've also heard that some will be permanently damaged above 60K ft. And then there's the EMC issue of 250 W peak RF pulses at about 1 GHz getting into the other electronics on the flight string, including, ironically, the GPS!

Another interesting development is a new FAA position reporting scheme, not unlike APRS and findu, which will eventually replace air traffic control radar and transponders. (The acronym escapes me at the moment). This scheme is now in full use in Australia and some EU nations, and is being beta-tested by the FAA on the east coast. Once that scheme is

in place, there are no insurmountable technical barriers to linking
our findu reports right into that system; but let's not hold our
breath on that one ...

In the meantime, I'd not recommend running out to buy a transponder
right now. Denver Center's and more recently Denver TRACON's experience
with our reliable findu.com reports in FAA vernacular, coupled with
the controllers' understanding of balloon flight dynamics, has made life
much easier for them than ever before.

And this gets down to my final point: the FAA folks are regular folks
just trying to do their jobs as well as they can without a whole passle
of trouble. To the extent that we, as high altitude balloon operators,
can help them out and not hassle them when they balk, then we can forge
a sound working relationship with them that will yield some latitude
when we might need it.

This relationship can pay dividends from time to time. For example,
EOSS got an OK to launch thru a solid overcast that developed while
students were struggling to get their payloads working on launch
morning.
The floor supervisor said they were vectoring traffic away from that
area
anyway, so the airspace was all ours.

And just yesterday, I was surprised to hear that ARTCC and TRACON both
OKed the launch of EOSS-100 from a site just 28 NM W of DIA in November,
despite its being directly under one of DIA's approach gate fixes. They
said it would be a hassle for them to vector traffic oddly, but that
since EOSS had been so cooperative with them in the past that they'd
give
us a break for that special occasion.

Now, it does take some time and a number of flights to develop this kind
of relationship. And there will be times that you have to bite the
bullet.
Those are the times when trust develops quickly, so don't blow it by
reciting FAR 101 or otherwise being a hard ass - that'll get you no
farther than arguing with the state trooper who just pulled you over for
10-over. It's OK explain the impact that compliance with their demands
will have - but only after having said "Yessir, yessir, two bags full!".

Sorry for the novelette, but I thought that some of the newly emerging
balloon groups might benefit from some of EOSS's experience.

Mike,

Thanks for the very nicely detailed explanation of the EOSS experience with FAA over the years.

Your post raises several questions for me, but by far the most intriguing from my perspective revolves around the following notion:

> 1. EOSS interprets "payload" to be that part of the flight
> string that is essential to the flight mission, regardless
> of the kind of airframe that gets it to altitude.
> Accordingly, we don't count the weight of the balloon,
> parachute or cutdown device in payload weight for FAR
> 101.1 purposes.

How did that interpretation arise? This is the first I've heard of anything like that.

Hank

Hi Hank,

That's just what I personally read the term to mean. It's what
the lift system gets paid to do - like a 10 kg satellite on top
of a 1000 kg rocket.

YES! Well, some elements of the FAA seem eager to overstep the written policy and in effect end up discouranging a legally sanctioned activity. Some of the co-ordination actives by some Colorado area ham radio high altitude balloon groups- although well intended- I think have actually muddied the water in the Colorado area FSDO. I'm am an aerospace engineer by profession, am an active hot air balloon pilot, and have interest in innovative new technology for balloons and near-space projects. I've formed my own group "ES-OS" (Experimental Sub-Orbital Society) to fly the missions deemed too innovative by another Colorado area balloon group that I've been active in.

"ES-OS" has - safely and prudently - flown payloads as heavy as 152 lbs, and home built polyethylene bags larger than 100,000 cubic feet. I prefer to operate solely under the provisions of FAA part 101, which requires NO notification/coordination for sub 12 lb missions (maximum 6 lbs per individual payload unit, ballistic coefficient limit, too). For 12+ lb flights, Part 101 flights are only supposed to have 6-24 hour notification (not permission) and position reports as requested by ATC. Previously, the local FSDO scratched their head, kicked it to regional in Seattle. The guys in Seattle come back with a 45+ day prior required waiver process which can be a real demoralizing inertia-killer. It's been a real mess. The few times that "ES-OS" has been through this extra-legal waiver process, it has been handled in a not too professional and not really satisfactory manner.
For example - I don't want to waive anything - all of my 12+ lb flights have been in full accordance with all provisions of FAA 101, including inclusion of radar reflectors - yet I have been orally informed by an FAA official that a non-exempt flight needed a waiver. One waiver for a 40 lb flight to 85,000 feet came back with boilerplate inserted for a tethered operation, requiring winching down the balloon if an aircraft approached. No one could tell me where to

get 85,000 feet of lightweight tethering material or a super high speed winch.
Another waiver request came back with FAA-inserted boiler plate text and incorrect contact info from a prior balloon mission from a different group.
And the 45 day prior waiver request requires the applicant to predict the flight trajectory of the balloon.... 45 days prior to the flight!
Clearly, the situation would benefit from reform-adherence to written policy- here in the Denver area.

The situation is really a mess for Colorado area ARHABians, stemming largely from the local FAA's lack of knowledge of their own written regulations and in part I think from other Colorado-area ARHAB group's over willingness to indulge out-of-control FAA bureaucrats in their attempt to over-control a completely legal, ethical, non-polluting, safe, educational and usually fun activity.

My standpoint: operate legally, safely, and ethically. I do not think it is ethical for FAA personnel to levy arbitrarily derived requirements on any aviation activity that is in full compliance with all written regulations with the exception of course of some unforeseen emergency situations where the ATC guys will do what it takes to prevent a dangerous occurrence.
I always prefer to stick with the provisions of part 101- it is the sole WRITTEN policy on unmanned balloon flights as far as I know. If we all abide by written policies, then we're all on the same page and fewer surprises will result. But, politely indulge extra requests when tendered by the FAA, although I feel the ARHAB community will benefit if we all politely and in a professional manner encourage the FAA to abide by their written policies. If the FAA wants to revise/amend their written policies I am perfectly fine with that, but when different flight districts all deal with similar balloon flights in an individualized manner, there is a total break down of national uniformity. As far as "building a relationship" with 'your local FAA'; seems to me there is benefit when all activities are in accordance with publicly available written policies, and a detriment to future new comers when unwritten SOPs evolve over time.

I know of at least 2 instances where a sub 12 lb part 101 non-exempt flight has been ki-bashed by unknowledgeable FAA personnel for seemingly arbitrary

reasons. My prior standpoint was: notify the FAA - even though part 101 exempt sub 12 lb do not require it- as a courtesy to the rest of the aviation community. But since those instances, I'm rather loathe to do.

Regardless of all this water under the bridge, I'm sure many in the community would like to know of your situation there, as it evolves.

As I pointed out in a early message, it isn't a matter of whether this type of "on the fly" rule making is "ethical", it is flat out illegal. There is a defined process for government rule making. Some agencies, such as the FCC, follow it religiously, other such as the FAA and the ATF, do not. Now making an agency follow their current rules or go through the proper rule making procedures is another thing. This can be very expensive and extremely time consuming.

It was suggested that maybe it is time to work with the FAA to draft new rules. I would be careful about asking any bureaucratic agency for new rules. The end result may be a new set of rules that no one can comply with, effectively ending this hobby as we know it.

Follow the rules as written and leave the sleeping dogs lie.

Hi John,

I don't think those collision avoidance systems aboard aircraft
are using active radar, but rather are listening to each other's
transponders. Not sure, tho, so it's a good question.

Note however that all aircraft operating above 18,000 ft (FL180) are
under positive control, so they'll get ATC advisories if the controllers
know where your balloon is.

Gentlemen,

A mid-air or a near miss with an undocumented balloon flight
that causes a violent avoidance maneuver that injures a passenger is
a sure-fire way to bring this hobby to an end.

The FAA will react by amending FAR 101 with draconian regs not unlike
those that burden the amateur rocket community. Rest assured that, in
the aftermath of such an event, this politically reactive process will
not grant much weight to input from our ragtag community.

Yes, the risk is historically quite small, but it is steadily
increasing in proportion to the file size of Ralph's ARHAB
announcements. The majority of our payloads oughtweigh modern 2#
NWS RAOBs, airliner cruise speed have risen by 150+ kt and air traffic
density has tripled since the last rev of FAR 101. Kinda like the risk
of a Cat 4 hurricane hitting New Orleans, by n' by, it'll happen.

The FAA's authority is not strictly limited by FAR regs. They also
have been granted certain discretionary authority which allows them
to issue rules without an act of Congress. The rules re UAVs in
civil airspace are a good example. So adopting a righteously
indignant attitude to the contrary is dangerously naive.

My 15 year experience with drafing medical device safety standards
that ultimately become international law have convinced me that input
from all parties, despite opposing interests, can be accomodated
with minimum net impact, so long as that input is offered and
supported in term of the agreed-upon goals of the forum.

Those who don't come to the party generally get screwed, however.
Reading the Fed Reg minutes behind the amendments to FAR 101
indicates to me that this process operates at the FAA as well.

Sure, we can keep on truckin' in hopes that the God Forbid
doesn't happen.

Or we can be proactive and participate in structuring the rules so
that everyone, regulators and regulatees together, understands
clearly how best to avoid the God Forbid and how to achieve that
goal without smothering under a bureaucratic morass that kills the
hobby, but rather unifies and simplifies how we go about it.

1701. TNC-X now has X-Digi available

Yahoo group: GPSL (2002 — 2008)
Date: 2005-09-29 18:11:27 UTC
From: n9xtn@cox.net
Topic: 1701 Message: 1701

I haven't read over all of the documentation on this yet, but it could be an alternative to using a KPC-3 if you want an airborne digipeater. From the schematic it appears it could be powered by regulated 5V as-is or through the on-board 78L05 regulator. If you're building it from a kit, you might want to replace the 78L05 with a low-drop-out version.

For home use, a USB option is available for those who'd rather not deal with a serial port converter.

Is anyone out there doing KISS mode with a Basic Stamp? That's my next little project.

73 de Mark N9XTN

==========

Announcement:

X-Digi is a daughter board for the TNC-X that is based on the UIDigi firmware. It allows a TNC-X to become a stand alone digipeater. It fully supports the WIDEn-N paradigm including UITrace and UIFlood and also does user configurable dupe checking. It has extremely low power consumption and is an ideal digipeater for use in emergency situations.
It supports four independent beacons with separate user configurable paths. The X-Digi configuration parameters can be set using a computer
that runs any terminal program - even a Palm Pilot (though it is not configurable over the air). X-Digi is field upgradable via a computer serial port should firmware upgrades become available.

More info is available at:

www.tnc-x.com

X-Digi is available now. Thanks for the bandwidth.

Mark: this sounds pretty cool. A flea weight digi
would be a welcome addition to any ARHAB group's
airborne arsenal. Let us know how your project shapes
up.

I don't know if this would be any lighter or less power-hungry than a KPC-3 removed from its case, but it would less than half the cost (a new KPC-3 goes for about $170 nowadays, the TNC-X/XDigi combo is $68).

That "almost TNC" will probably work fine with >30 dB SNR packet
sigs; it simply applies clipped receive audio to a comparator port
(1-bit ADC). An external FSK demod would have been an immense
improvement at negligible added cost, weight or power consumption.

Hi Mike,

Yeah, mylar is stronger, but it's also heavier and it doesn't stretch.
So a mylar bag that can accomodate a volume expansion of 100 x,
necessary to go from sea level to 100K', would very like outweigh
the payload by many times. The modest 1200 gram (2.64 lb) latex bag
expands to about 30 ft diameter just prior to burst.

And if you think latex is fragile, try keeping holes out of the
0.25 or 0.35 mil polyethylene skin of a Raven plastic balloon during
prep and fill!

1706. Telemetry file from 2005C

Yahoo group: GPSL (2002 — 2008)
Date: 2005-10-01 17:59:36 UTC
From: Ralph Wallio, W0RPK
Topic: 1706 Message: 1706
Attachments: 1 described; binary payloads are missing from this source WARC

Zack,

I set up two receiving chains on 144.340, one horizontally polarized the other vertically polarized. The attached file was copied via horizontal. I did not copy a single packet via vertical (weak signal only heard, not copied). The vertical chain was tested using local traffic before your flight and using the CAP-N-SPACE downlink on 144.360 after your flight.

My path for this packet was 309.11mi. Records have been updated accordingly.

Hi Mike,

Well, hydrogen will burn in the upper atmosphere, provided with a near-adiabatic supply of oxygen. After all, that's what the NASA Shuttle main engines run on.

However, if you were to use the hydrogen for propulsion, then you'd have a rocket. And if you think FAR 101 is tough for balloons, check the same regs for rockets!

ANd you're right about hydrogen being a bit dangerous. It does yield maybe 10% more lift than helium and it costs a lot less. But all the ignition-avoidance and fire protection you'd be compelled to deal with isn't likely worth those benefits.

1709. Re: [GPSL] Telemetry file from 2005C

Yahoo group: GPSL (2002 — 2008)
Date: 2005-10-02 19:45:51 UTC
From: Zack Clobes
Topic: 1706 Message: 1709

Thank you.

Our actual peak altitude was 111,083 feet as logged in the telemetry of
AJ0NR-11

AJ0NR-11>APRS:{{D1621,*33858*,+020,11791

1710. Outside Air Temp vs. Altitude

Yahoo group: GPSL (2002 — 2008)
Date: 2005-10-03 02:20:54 UTC
From: Zack Clobes
Topic: 1710 Message: 1710

During the last chase we were discussing why the temperature was climbing up near the burst altitude.

www.rckara.org/temp/2001b.pdf

The above link is to a graph that I produced after our 2001b launch show the temperature rising back up to nearly freezing level at burst. The launch was in August of 2001. We haven't flown the OAT sensor very much, so this may be our only chart of the data, but many other groups should have similar data.

I'm curious how these temperatures vary throughout the year...

Concur!
We also observe the same response on flight 2005C of August 6th 2005,
here is the link to the temperature plot:

Do you have any data from other months of the year?

Long term averages of temperature increase with altitude above the tropopause as can be seen in U.S. Standard Atmosphere (see http://www.pdas.com/atmos.htm). At the tropopause, 11.1-20.0km, USSA is -56.5dC. Temperature then increases to a maximum of -2.5dC, 47.4-51.0km, and then starts back down all the way to the top of USSA, -85.23dC at 85.5km.

These averages are broken down by latitude and month-of-year in Global Atmospheric Circulation Statistics, 1000-1mb, NCAR Technical Note 366 (the same NCAR/TN I discuss in http://showcase.netins.net/web/wallio/MZW.html - Mean Zonal Winds). Down in the banana belt at 35dN the averages for 10mb (31.2km) vary -45 to -36dC, winter to summer.

From these averages it appears ARHAB temperature measurements approaching 0dC at typical burst altitude are roughly 40dC high. So what could be the problem(?) Lets assume sensor calibration at the surface is correct when directly illuminated by the sun where Atmospheric Mass = 1.5 (AM1.5). Is it still correct at altitude when illuminated at AM0 (with no atmospheric attenuation)(?).

Most all atmospheric temperature sensors are designed to be shielded from sunlight for proper operation. If you are operating a LM335-type sensor, for best results it should be placed in something that provides free air flow over the sensor yet blocks the sun. I made a quick housing for mine out of a block of foam with a hole cut lengthwise through the middle that is oriented vertically on the payload (the sensor is attached so it is in about the center of the block). Even with this design, our temperatures run higher than the radiosonde temps above 60 kft, so it's still not perfect.

Based on NSTAR's flight experience, the sun provides a lot of warming at high altitudes. The combination of more intense sunlight due to less atmospheric attenuation, plus (more importantly) far less heat carried away by convection in the thin atmosphere leads to heating above the ambient temperature. Once the sun goes away, temperatures will drop off dramatically.

From Saturday morning's sounding at Topeka, the temperature at 107,000 ft (highest altitude reported) was -45°C.

I've run tests on temperatures and color in near space. I can warm up a 2 inch cube by 10 degrees (or more) by painting it black.

Surprisingly though, the aluminum block was cooler than the black one. I understood that aluminum had a high reflectivity, but low emissivity. The net result being that once heat got into the aluminum, it was difficult for it to get out. This si why we cover potatoes in aluminum foil.

Paul

Hi Zack,

That's the tropopause you're seeing - the interface between the
troposphere and the stratosphere. And yeah, the first time I saw
that, I thought we'd had an instrumentation problem.

All of the "weather" we experience occurs in the troposphere, where
the air density is high enough to promote significant convection.
Above that, the air temp increases due to reduced solar flux
attenuation,
lack of significant convection and, of course, very low thermal mass.

The elevation of the tropopause varies from above 60K' in the summer
down to under 30K' in the winter.

One thing to watch out for with OAT sensors: the low air density at
altitude restricts heat transfer between the temp sensor and the air.
If there's any self-heating in the sensor, then it'll read high.
Especially during the 1000 fpm ascent. But after burst, when your
airspeed gets near-Mach-ish, that heat transfer improves dramatically.
Thus, you're likely to a much lower OAT vs Alt curve during descent
than during ascent. You can minimize this error by putting a thin
heatsink on the sensor, exposed to full ambient airflow, but also
shielded from solar heating (tough trick, but check how radiosondes
do it).

Kewl science for your kids, huh?

Hi Paul,

At optical wavelengths, Al does have high R and thus low E, i.e., it's bright-looking. But at IR, the opposite is true! Same is true for Chromium - which is why chrome trim on a car sitting out in bright sunlight can burn you. Similarly, a black anodized heatsink is not much more effective at far-IR radiative wavelengths than is bare Al surface.

If you really need a good solar absorber/emitter, use carbon black based paint. As close to a pure thermal "black body" as you can get from local sources.

1719. hydrogen safety.... propulsion...> 1. Re: Stronger balloons?

Yahoo group: GPSL (2002 — 2008)
Date: 2005-10-03 21:15:21 UTC
From: K. Mark Caviezel
Topic: 1719 Message: 1719

A big issue with hydrogen propulsion from a balloon is the feed system. My advice: If you've got something that needs to go to balloon altitudes- use a balloon. If you've got something that needs to go to rocket altitudes- use a rocket.

As far as hydrogen danger and safety, I helped assemble and launch a netted manned gas (hydrogen)balloon Sunday at the Albuquerque International Balloon Fiesta. Those pilots (Wallace and Brielmann) flew over 1100 miles. 7 manned balloons were inflated with hydrogen and launched at AIBF on Sunday night without incident. Each balloon has a gross lift of about 2000 lbs. Amateurs can achieve a safer operation than achieved at AIBF by avoiding use of ferrous tools on leaking fittings, using a low pressure or pre purged (nitrogen, CO2, argon) fill line. Any welding gas distributor will have a compressed gas safety booklet. Understanding and actually implementing all of the advice therein will lead to a safe operation. Don't be afraid of hydrogen if you want to use it- but do respect it and use it in accordance to CGA recommendations. Use of helium also has significant safety issues - mechanical energy of the compressed gas and asphyxiation potential. Regardless of your favorate lift gas be sure to read up on proper use.

The gas race is a cool APRS application:
http://www.balloonfiesta.com/Gas/tracking/index.php
The trackers were sealed in a Pelican case with batteries... 9 lbs total.

1720. Fw: Near Space Competition

Yahoo group: GPSL (2002 — 2008)
Date: 2005-10-04 04:12:10 UTC
From: Gene Harlan
Topic: 1720 Message: 1720

Trying to get a message to Paul, but it keeps getting rejected. See below Paul.

Also, any balloon articles coming for the Fall issue?

Gene - WB9MMM
ATVQ

Subject: Re: Near Space Competition

You know, I never heard who the winners were. Let me know and I will get them added to the mailing list.

Subject: Re: Near Space Competition

We'll announce the competitions to the public next month. At the end of the year we'l
announce the winners and send their awards. So the subscription would be for
2006.

Here's the current competitions.

Maximum altitude (current record 120,522ft 20Mar99)
Longest flight great circle distance (current record 1201.18mi 18Dec04)
Longest flight in time (current record 22h42m11s 18Dec04)
Telemetry great circle range >50Mhz (current record 479.5mi 17Jul04)
Telemetry great circle range <50MHz (current record 2,437mi 15Nov00)
QSO great circle distance (current record 647mi 25Oct03)

So you have a preference for your sponsorship?

Thanks for helping out,
Paul

From: PAUL VERHAGE
Topic: 1720 Message: 1722

I can probably do something, if no one else was planning.

Mark, Mike, or Ralph, do you have a topic to write about?

Anyone else?

Paul

1723. Re: [GPSL] Fw: Near Space Competition

Yahoo group: GPSL (2002 — 2008)
Date: 2005-10-04 16:38:52 UTC
From: n9xtn@cox.net
Topic: 1720 Message: 1723

Maybe the new group on the block (CNNSP) can write one on their first year?

I'm not finding time to do a heckuva lot related to balloons these last 2-3 months, except kibitz by e-mail when I should be doing other things.

1724. ATVQ Article

Yahoo group: GPSL (2002 — 2008)
Date: 2005-10-04 17:29:53 UTC
From: PAUL VERHAGE
Topic: 317 Message: 1724

Is CNNSP interested in writing about their group and experience?

Don, are you interested in doing an article on the digital camcorder HABITAT used at GPSL 2005?

Paul

> Is CNNSP interested in writing about their group and experience?

I think I could put something together.
How soon would it need to be completed?
Let me know any other specifics...length, photos, etc.

I've solicited EOSS members for a hack to do a piece on
EOSS-100 / 15th Anniversary bash. If our 7000 gm altitude shot
works as hoped later this month, maybe something on that
as well.

Rog,

We are actually past the dealine as it was October 1st. Any chance to have something by Saturday the 8th?

A couple/three pages would be good. Pictures are a plus (JPG will work). Text can be Word or almost any other format. If pictures are included in the Word document, please send them seperately as well.

Let me know if this is possible.

Thanks.

Uhhhh.... I dunno. That was four years ago.. :-)

I'm using the ?LM-35CTZ? (or thereabouts) temp sensor. For external temps, I was using the one rated down to -55C. As I recall, I put the whole sensor including the solder joints into a sleeve of black heat-shrink.

The sensor was designed to just hang from the three wires, probably out of the lid, but I don't recall precisely. My guess is that it was exposed to sunlight.

Sorry, I haven't been keeping up with the mail. I just saw this, home on a sick day, after seeing Gene's reply to Roger.

I had planned on this, but got sidetracked - isn't that a first - I'll try to get this done and to Gene before the end of this week.

I've actually got some new info, and more video on the web site. Gene is it okay if I put the link in the article, since the files are video and kind of large. ;-) I do have a few captured frames for the artice.

Thanks!
Don

1733. ANSR-26 a GO!

Yahoo group: GPSL (2002 — 2008)
Date: 2005-10-08 03:55:40 UTC
From: kd7lmo
Topic: 1733 Message: 1733

The ANSR-26 High Altitude Balloon flight is a go for 8:00 AM MST (1500 UTC), Saturday, October 8th. The following is the payload frequency plan:

Cross Band NB-FM Voice Repeater
Input: 145.560 MHz/162.2 Hz PL tone
Output: 445.525 MHz

APRS when repeater not in use on 445.950 MHz at 10, 20, 40, and 50 seconds UTC time via KD7LMO-11

Landing prediction after burst at 15 and 45 seconds UTC time via KD7LMO-0

Linked to IRLP reflector 9255 * See Notes below

Pico Beacon APRS
445.950 MHz packet at 00, 25, and 35 seconds UTC time via KD7LMO-11

Our mobile cross band Digipeater will repeat the APRS data to the 144.390 MHz standard APRS frequency and thus will be I-GATED to the Internet for out of area trackers. You track the flight using either of the following links:

http://www.findu.com/cgi-bin/find.cgi?kd7lmo-11
http://map.aprsworld.net/kd7lmo-11

Pre-Flight Discussions starting around 6:00 - 6:15 AM

Sacaton Peak, 447.725 MHz/100.0 Hz PL tone

Launch Location: I-8 at the Freeman Road Exit

* NOTE on IRLP reflector. When you connect, the node will report you are connected to the Western States Reflector 925 on channel 5. This channel has been reserved for high altitude balloon flights. Remember to key your transmitter for 2 seconds BEFORE you begin to talk. Also, when you join the node, please listen 10-15 seconds before transmitting. The cross band repeater is also used for our tracking and recovery team.

1734. Re: ConHAB Launch Update, READ THIS!!!

From: Ralph Wallio, W0RPK
Topic: 1734 Message: 1734

Paul,

All of us are very interested in how this develops. Please keep us advised. Perhaps it will help for you to compare notes with Dr. Mani Mina at Iowa State University.

Note new e-mail and web addresses.

To All --

This was to be a Part101-exempt Concordia College ConHAB flight.

It is difficult to believe this is just a coincidence. Both ISU and Concordia are flying in Minneapolis ARTCC controlled airspace. Something has triggered this, e.g., an FAA meeting topic, an FAA memo or FAA directive. We need to know what has changed ... it would help to have a copy of a memo or directive.

Did any of the following flights file NOTAMs:

ORB-18 08Oct05
ANSR-26 08Oct05
TRAVELER 2005C 01Oct05
CNS-005 01Oct05

Subject: ConHAB Launch Update, READ THIS!!!

I just received a call back from the Grand Forks Flight Service Station, with whom I'd filed a NOTAM for our flight. They informed me that we may actually need an FAA waiver (instead of the notice we filed), and that they would not issue a NOTAM until that was resolved, even though we've never needed a balloon waiver before.

Unfortuanely the Fargo office I was told to contact is closed on weekends. So needless to say our launch is now cancelled for tomorrow.

I figure this is going to take a while to resolve.

Sorry for the false alarm.

In short, yes, PT 2005C DID filer a NOTAM this time.

Normally, we call the local tower (class D airspace) a couple of days ahead of time and they ask me the standard questions (launch site, flight prediction, ascent rate, etc) and I'm told that they are filing a NOTAM for it. I never hear much back beyond a quick call to the tower 10 minute prior to launch where they give me the go ahead.

This time however, I apparently got someone new in the tower who had me call Flight Service out of Wichita where I actually filed the NOTAM with them. Nobody was really sure how to file the NOTAM, but in the end, the questions they asked were very similar to the form that EOSS has posted on their site for their flights.

They didn't give me any hassles... A few flights back, we forgot to call the tower on Friday and when I called in Saturday morning, they threatened not to let me launch because of the short notice, but they did work with me. It didn't seem to matter to them that we were "Exempt".

Uhhhh.... I dunno. That was four years ago.. :-)

I'm using the ?LM-35CTZ? (or thereabouts) temp sensor. For external temps, I was using the one rated down to -55C. As I recall, I put the whole sensor including the solder joints into a sleeve of black heat-shrink.

The sensor was designed to just hang from the three wires, probably out of the lid, but I don't recall precisely. My guess is that it was exposed to sunlight.

Topic: 1734 Message: 1738

As a data point, but not particularly relevant to the discussion of what may have changed recently within the Minneapolis ARTCC area of responsibility:

I've filed NOTAMs with both Columbus FSS (Nebraska launch sites) and Fort Dodge (Iowa sites). Ft Dodge will ask if we have a waiver on file. I tell them we are Part-101-exempt and that a waiver is not required for our flight, but that I am filing a NOTAM as a courtesy. They then proceed to take down the information and enter it in the system. Columbus is far less familiar with HIBAL NOTAMs, but does enter them.

Sometimes there is a little hesitation from the FSS to take the info w/o a waiver on file, and I've had to emphasize that we do not require a waiver because of our light weight and density, etc. Once they understand we're doing this as a courtesy and not as a FAA requirement, they're OK with it.

Perhaps next time we won't be able to file the NOTAM so easily.

Paul,

All of us are very interested in how this develops. Please keep us advised.

Perhaps it will help for you to compare notes with Dr. Mani Mina at Iowa State University.

Note new e-mail and web addresses.

To All --

This was to be a Part101-exempt Concordia College ConHAB flight.

It is difficult to believe this is just a coincidence. Both ISU and Concordia are flying in Minneapolis ARTCC controlled airspace. Something has triggered this, e.g., an FAA meeting topic, an FAA memo or FAA directive. We need to know what has changed ... it would help to have a copy of a memo or directive.

Did any of the following flights file NOTAMs:

ORB-18 08Oct05
ANSR-26 08Oct05
TRAVELER 2005C 01Oct05
CNS-005 01Oct05
ARSAT 2005D 10Sep05

OK. Now I can post to the group since I've finally gotten around to subscribing. Mark, your comments are interesting, because I did not say "Part 101 exempt."

What I did do was try to file a NOTAM. He asked if I had or needed a waiver. I said no. They took my info, and we concluded.

The called back about 45 minutes later and asked about the waiver again. I said I didn't have one, and was not required to have one. He said (direct quote) "My instructions say you need one." He referred me to the Fargo, ND FSDO, and gave me the number. I asked if the waiver was a new thing, as I didn't need one before, and UND has been flying for 5+ years without one. He repeated the "instructions"

thing.

Of course, Fargo FSDO is not open on weekends, so that effectively shut down our launch until I straighten this out. I'll post updates as they come in.

Yes I did file a NOTAM on Friday AM and nothing out
of the ordinary from FSS or the Tulsa International airport
tower proceedures manager. In fact the manager and I
talked for over an hour about just about everything. I did
call the tower radar super for a complimentary report today
as we passed through 40k and the same... nothing out of the
ordinary!

If your flight does not fall under FAR-101 and you are just
filing as a courtesy to air traffic, I don't see how they can
refuse to file the NOTAM. I would get the ID of the person
who refused to take it and call someone at the GADO office
during buisness hours and find out why it was refused.

1741. UX-3 Flight Announcement

Yahoo group: GPSL (2002 — 2008)
Date: 2005-10-11 04:51:42 UTC
From: Travis J. Maclay
Topic: 1741 Message: 1741

The University of Tennessee Amateur Radio Club (UTARC) is pleased to announce the flight of UX-3. This mission will be flown with the call of K4T-11.

This high altitude balloon flight will take place on Saturday, October 22, 2005, at 8:00 AM EDST (1200 UTC). The launch site will be the campus of the University of Tennessee in downtown Knoxville. Exact launch location will be the University Center Plaza at the corner of Andy Holt and Philip Fulmer.

Two (2) 3000-gram weather balloons filled with helium will fly in tandem. Expected burst altitude will be 100,000 feet or more. Flight time is expected to be about 2.5 hours.

The following devices will fly on this mission as part of the payload:
Primary APRS / voice telemetry
Backup APRS transmitter
433 MHz beacon
10-meter transmitter (voice telemetry)

Pre-flight path predictions are available via the internet at:
<http://www.reachingnewheights.org/ux3>
http://www.reachingnewheights.org/ux3

Information on this and previous flights can be found at
<http://balloon.utarc.org> http://balloon.utarc.org

Tracking for this flight can be located at:
<http://map.findu.com/k4t-11> http://map.findu.com/k4t-11

For more information, please contact Travis Maclay (N4TJM) at
tjmaclay@...
Thanks to KD7LMO <http://www.kd7lmo.net> for use of announcement
script.

Roger - KC0MWM
CNNSP

****

Lockheed Martin starts running FSS stations

Just after midnight on October 4, the FAA officially turned over control of the automated flight service station system to Lockheed Martin to run under contract.

"AOPA was an advocate for this switch, because it was the only way to modernize flight service and improve services to pilots," said AOPA President Phil Boyer. "Now we take up our watchdog role, to make sure pilots ultimately get everything that Lockheed Martin has committed to in its contract with the FAA."

Pilots won't likely notice any change in the near future. Today it is essentially the same people using the same equipment as yesterday. But as Lockheed Martin phases in new equipment and new procedures, pilots should eventually notice service improvements. The contract is expected to save the FAA and taxpayers more than $2 billion over the next 10 years.

The FAA and Lockheed Martin established a command center with open lines to all 58 flight service stations to monitor the switch-over. They report that so far all of the shifts have been staffed, and all of the equipment is working.

1743. ConHAB FAA troubles resolved!

This is the followup to my adventure with the FAA and my cancelled flight this last weekend.

I called the Fargo FSDO office, and talked to an agent there. After explaining my story (being told I needed a waiver for the exempted flight by someone in the Grand Forks AFSS), he did some research, and called me back.

The problem stems from the fact that the AFSS in North Dakota has been outsourced to elsewhere (Princeton) in just the last two weeks. The new outsourced agents simply didn't know what I was trying to do, or what to do about it. I was given a number that goes directly to an agent in the actual Flight Service Station in Grand Forks who is familiar with what we are doing. Problem solved.

The Fargo office did say that while I don't technically need to file a NOTAM, they would like it if I did. That way the FAA knows what I'm doing and when, and it gives me some protection if something goes wrong (in that I understand the rules/followed them/made projections of where the balloon is going). He also added that I definitly don't need a waiver.

Next tentative launch date: October 30.

> Subject: [GPSL] ConHAB FAA troubles resolved!

Way to go Paul!

Most of the time when I file exempt, I tell the FSS what they
need to know. They really haven't a clue. I was told by the FSS
that the NOTAM system is pretty overloaded and it's lucky
they get filed at all. When you file, ask for the ID of the operator
that is filing your NOTAM. Just another bit of info that might help
if needed in the future.

Here's an example of the data I keep for every flight. The time for launch
is
what you want the duration of the NOTAM to be. The rest is all the info the
FSS ever needs. The time on the last line is the time I actually file the
NOTAM.

Launch: 04/09/05 1300z - 1800z
Launch Site: TUL VOR 10 nm / 303 radial - MA2 Sperry 36.30737/95.946355
Land Site: TUL VOR 12 nm / 303 radial (Predicted)
NOTAM#: TUL D 10 / 1004 Oper: " MD " Time: 10:24 CDT / 15:24 z 10/07/05

The next time I file a NOTAM I give the FSS the previous number. They bring
it up
on their computer and modify it for the current NOTAM being filed.

Good luck on the next flight!

1746. Payload weight

Yahoo group: GPSL (2002 — 2008)
Date: 2005-10-19 12:54:04 UTC
From: Ralph Wallio, W0RPK
Topic: 1746 Message: 1746

Nikhil,

I forwarded your discussion to our GPSL email list which may result in comments from others. I suggest you subscribe to this list via GPSL-subscribe@yahoogroups.com because it carries many/most similar inter-group discussions.

Since FAA FAR101 is (purposefully?) vague, incomplete and non-specific it seems reasonable to interpret it to our advantage. This allows us to apply weight limits just to payload enclosures, e.g., two payload enclosures weighing <=6-pounds each. In my opinion we do -not- have to include parachute, tow line or other small miscellaneous weights in the 12-pound total.

Subject: payload weight

hi Ralph,

This is Nikhil from the HABS program at University of Kansas. I have an issue
regarding the weight of payload that can be flown without having to go through
the red tape with FAA.

Based on FAA regulation 101.1 , the total weight of the payloads should not be more than 12 pounds and each payload should not be more than 6 pounds. What
is not mentioned clearly is whether the parachute and the straps/ropes used to
attach the parachute to the boxes are considered as payloads, i.e. whether the
weight of the parachute and ropes is considered in the 12 pound limit. If you
have any input on this , I would appreciate it .

Thanks,
Nikhil

Please Save the Date!

On November 12, 2005, the Edge of Space Sciences Organization (EOSS) will be celebrating its 15th anniversary. EOSS is a non-profit organization that promotes science, engineering and education by exploring frontiers in amateur radio and high altitude balloons.

To mark this important occasion we will make our 100th EOSS launch. In addition we will recognize the contributions of key individuals who have demonstrated extraordinary dedication to fulfilling the EOSS mission to further interest in science, engineering and education. Please make your plans to attend today!

What: EOSS-100 Mission, Presentations, Lunch Reception
When: November 11, 2005, 7:00 p.m. Dinner with High Altitude Balloon Pioneers at Longmont, CO
When: November 12, 2005, 7:00 a.m. - 2:00 p.m. (Launch at 7:30 a.m.)
Where: Intrado Headquarters
1601 Dry Creek Drive
Longmont, CO 80503

Rain date: November 13, 2005

More details to follow. We hope to see you there. Let us know if you can attend and reply to: wa0geh@...

Thanks from your EOSS event team,

Marty Griffin, WA0GEH
Jim Gifford, K0LOB
Steve Meer, K0SCC

EOSS flew three APRS systems aboard two balloons today. Two seem to have a 30K meter limiter built into them. We will examine this in the coming weeks and report to Ralph on possible GPS engines with this as a problem.

No records were set. The first balloon ascended to 97K and quit reporting altitude at 15:15:28 UTC. At that time the average ascent rate was around 1200 fpm. Burst was observed optically at 15:30:21. So, even if we were receiving telemetry burst would have occurred at approximately 117K feet and left us short of this year's current record of 118,352 feet ASL. That was the 7000 gram latex envelope.

The second balloon had two GPS systems aboard. One failed, the other worked fine and that system ascended to 113,953 ft. ASL. This was a new 3000 gram latex balloon.

When each failed GPS system descended below 30K meters it once again began functioning. So, we had a fairly routine recovery day as far as finding the payload systems. However, one did require a bit of a hike and descent into a ravine of some kind. I just heard about this peripherally and expect more detail will be forthcoming in the form of pictures or perhaps a text recap from that recovery team.

A web recap is in progress and as photos arrive will be fleshed out. But, if you're interested in data you can find flight logs on findu.com for:

Ae0ss-11
K0yuk-11
K0ani-11

I will post these logs and comma delimited versions over the next few days at the recap pages.

http://www.eoss.org/ansrecap/ar_100/recap9899.htm

Hi Ralph,

Those 97K' max altitudes were the result of the apparent 30km elevation limits in the new Rockwell Jupiter GPSs that flew in K0YUK-11 and AE0SS-11. We viually detected burst on EOSS-98 about 15 minutes after the last report from K0YUK-11 at 97K'. And EOSS-99 was also carrying K0ANI-11, which used an older version Jupiter, and that one reported over 113K' max'; might see if findu still has that log.

Lesson learned: Not ALL Rockwell Jupiters will report to 40,000 meters! The older ones have a full shield over the RF and IF sections, while the new ones we flew only had a partial shield. We intalled the new Jupiters because they tested on the ground with much faster acquisition times and better weak signal tracking, never suspecting that they also had reduced max reporting altitudes. Caveat emptor!

But the bottom line is that no, EOSS didn't bust the all-time record of about 121.5k' or the 2005 record of about 118k'. We did improve on our "personal best" by about 10K', though. We ain't given up, however!!

All

For a KPC3+, how do you turn off ' <UI>:" so instead of:

K2BSA-11>GPS: <UI>:$GPGGA,133329,3913.2514,N,.............

you get:

K2BSA-11>GPS:$GPGGA,133329,3913.2514,N,.............

I thought it was
HEA=off
But that doesn't seem to help.

Thanks in advance!

Mike,

Thanks for reporting the problem. We have the older Jupiter version you (and I) have flown successfully in our GREEN list with model number and software version. We need equivalent information for the newer receivers in a new ORANGE list at http://showcase.netins.net/web/wallio/GPSrcvrsvs60kft.htm.

Please forward model number and software version which I will add to the list with information about your experience.

I think you'll want to turn MCOM off.? This is out of the manual on the MCOM command.
MCOM {ON | OFF}
default OFF
Supervisory (control) packets are not monitored unless MCOM is set ON and
MON is ON. In addition if your station is connected, control packets are not
monitored unless MCON is also ON. Control packets, when displayed, are
distinguished from information packets by the ?<>? and ?<<>>? character sets
appended to the packet header. With these characters, a letter is included to
denote the type of control packet received, e.g. <> - a connect request
packet. The types of control packets are listed below.
Connect request
Disconnect request
Disconnected Mode
Unnumbered Acknowledge
In addition, the following bracketed information will be added to the Information
packets as appropriate:
Unconnected Information frame
Information frame (connected);
199
s = send sequence number
See also: ax25l2v2, monitor, mresp
For details on control packets, see the book AX.25 Amateur Packet-Radio Link-Layer
Protocol Version 2.0 October 1984, available from the ARRL.

Hi Troy,

Turn MCOM OFF.

If you're trying to get the TNC to work with APRS-SA, also turn off
MHEAD and MSTAMP - seems the code can't parse the UI text otherwise.

1761. Re: [Ballooning] NWS Balloon Tracking

Yahoo group: GPSL (2002 — 2008)
Date: 2005-10-26 04:20:59 UTC
From: Mike Manes
Topic: 1761 Message: 1761

Hi Phil,

Congratulations on your good luck in finding radiosondes! I'll betcha any balloon group would be delighted to have you join their team with your experience doing the pure-DF recovery job. With GPS APRS beacons now de rigeur in amateur radio ballooning, the bushel basket recovery is nearly a reality; it's not uncommon for the tracking team to be in wide-angle-lens range of the final decent and landing nowadays.

But those beacons are not 100% reliable, and often the terrain or posted fencelines bar that kind of activity. That when DFing is solid gold.

Lately, EOSS has been flying some 10-13 flights every year, and on 12 Nov, we'll be doing our 100th flight as well as our 15th anniversary. And we have a 100% recovery record ... so far. So there's not a lot of incentive to go chasing NOAA's RAOBs. And since I'm stuck with the ground station job, I haven't been on a T&R chase and recovery for many years. With the price of gas nowadays, that may be a coveted job, tho.

Sure glad that Bill Brown got back to you on his RAOB chasing. Bill is the acknowleged granddaddy of amateur high altitude ballooning, and was the inspiration for the founding of EOSS back in 1990. Before his first launch, 'way back when dirt was young, Bill used to do what you do from his QTH in Ohio. And from what he's sent you recently, he's still at it. Chronic case of balloonacy .... (I should talk ...).

1762. Balloon flight this weekend.

Yahoo group: GPSL (2002 — 2008)
Date: 2005-10-26 21:43:35 UTC
From: Zack Clobes
Topic: 1762 Message: 1762

Sorry for the late notice (again), but Jon has another payload to fly this weekend. See the Project: Traveler section of the website for details.

We will be launching again from the Hutch airport.

Note: Because of size constraints, this flight will most likely NOT be posted to Findu.com unless some kind soul in the central Kansas area would like to iGate us from 144.34MHz.

Zack Clobes, W0ZC
Project: Traveler

1763. EOSS 100: Flight Announcement and Invitation

Yahoo group: GPSL (2002 — 2008)
Date: 2005-10-28 03:09:50 UTC
From: Marty Griffin
Topic: 1763 Message: 1763
Attachments: 1 described; binary payloads are missing from this source WARC

Hi GPSL Friends,
This is a proud moment for EOSS. Can you help us pass this around via email and announce it on the many nets you attend? I have attached a one-page poster with the logo on it also. This message serves as an invitation for one and all. Please RSVP and we hope you can make it to Longmont on November 12!

- Marty, WA0GEH

++++++++++++ Snip Here ++++++++++++++++++++++++++++++++

Join Edge of Space Sciences (EOSS) as we celebrate 15 years of high altitude educational and scientific balloon missions by launching Flight 100!

EOSS is a non-profit Colorado organization consisting of scientists, engineers, amateur radio operators and educators who promote education and the sciences by using amateur radio and high altitude balloons to conduct missions at the edge of space. Over 21,000 high school and university students have participated in scientific balloon flights as a direct result of EOSS inspiration over the past 15 years.

This event is an opportunity to recognize the contributions of amateur balloon pioneers from around the nation and within EOSS. Hosts for this launch, ceremony and party are the kind folks at Intrado Inc in Longmont, CO. Here are the details:

WHAT: EOSS Flight 100. This flight is in support of the Colorado Space Grant College program and will fly four student-designed and built payloads. There will be a short recognition ceremony before the 8:00 a.m. launch from the Intrado east parking lot. Everyone can enjoy the launch and then move indoors to the auditorium. During the flight, you will be hosted in mission control, our multi-media auditorium while EOSS ground station personnel manage the flight. They will present the flight status, interact with the tracking and recovery operations, and provide amazing video on many large media screens. You are welcome to talk with the ground station folks and they will gladly answer questions about EOSS-100 or other flights or activities. Balloon pioneers from around the nation will offer comments and insights. The payload will be returned by helicopter and the wrap up party will begin. Food and drinks will be provided by our generous hosts, Intrado.

WHEN: November 12, 2005. Rain or snow date is November 13, 2005
6:30 a.m.: Pre-flight process, student experiment staging, flight string tests, balloon inflation
6:30 a.m. - 8:30 a.m: Breakfast feast starts, please RSVP
7:15 a.m. - 7:30 a.m.: Recognition ceremony at launch site

7:30 a.m.: EOSS 100 Launch!!
7:30 a.m. - 12:00 a.m.: Flight mission and recovery in mission control center
12:00 p.m. - 2:00 p.m.: Wrap-up party and reception starts, please RSVP

WHERE: Intrado Headquarters
1601 Dry Creek Drive, South East Parking Lot
Longmont, CO 80503
Talk-in 147.225, PL 107.2, 146.58 Simplex

DINNER FRIDAY NIGHT: Optionally, gather with us at the Armadillo Restaurant for an
informal "gab and eat" on Friday night, October 11 at 7:00 PM. The location is: 700 Ken Pratt Blvd, Longmont, CO 80501-6452, (303)-651-1116. The Armadillo provides very good Mexican cuisine at a reasonable price. We will be in a private area. Ask the host to direct you to the EOSS group.

LODGING: For those of you wishing to stay Friday night in Longmont, the official event hotel will be the Marriott Courtyard, 1410 Dry Creek Drive, Longmont CO 80503, (303)-682-1166. $89 per night for a single which does not include breakfast. This facility is right across the street from the launch site.

Nearby there is also a Days Inn, 3820 Highway 119, Longmont, CO 80501. $78 per night.

RSVP: If you think you may attend this event, please send an email to Jennifer Laverty, jlaverty@.... Advise her how many will be in your party for the breakfast and wrap-up party. This will help us plan for ample food and refreshments on launch day. Folks with RSVP will have priority at the breakfast and wrap-up party.

Additionally, if you plan to attend the informal Friday night dinner, please indicate how many will be attending so we can adjust the reservations.

FOR MORE INFORMATION: Contact Jim Gifford at K0LOB@.... Check www.eoss.org, and select Upcoming Flights. We hope to see you there!!!

Hello Zack: Jack WY0F in Grand Island, NE...Don't
know if I'll here you our not. but have tnc, 706 all
connected and ready to listen on 144.34 and anything I
hear will be iGated
later, have a good flight. We are flying the 5th of
November from the Wood River High School launch is
08:00 local.
later, Jack

1767. Project: Traveler to fly this morning

Yahoo group: GPSL (2002 — 2008)
Date: 2005-10-29 12:01:32 UTC
From: Zack Clobes
Topic: 1767 Message: 1767

Despite 17G25kt surface winds, PT will be attempting our fourth flight of the year this morning. We expect a launch at 8:30am from the Hutchinson airport (KHUT).

Tracking MAY be available at http://www.findu.com/cgi-bin/find.cgi?call=w0wr-11. We're flying on 144.34 and it just depends if enough Internet Gateways within our range have QSY'ed over to this frequency.

It appears Zack got his balloon off the ground even with the 30mph gusts at Hutchinson. KC5TRB is picking up some data from Tulsa. So far nothing heard here in Bellevue NE yet, but it's probably near or a little below my horizon now.

Nothing heard from any of the Igates who switched to 144.34 since about 0920 CDT. If you're in central or eastern Kansas, you might switch to 144.34 to see if you can pick up a signal. Hopefully it's just a little weak instead of having no signal at all.

I have my 10-el beam pointed south in the hopes of picking something up.

Also try to scan upwards from .34 slowly to .38
On my PT both (went dead or drifting up) had happened, also at around 40Kfeet.

That's what I've been doing, knowing that the PT's in the past have drifted.
I've scanned all the way from 144.000-145.000...Nothing!
If it's even putting out 10mw at altitude, I'll hear it.

Thanks!

I just ran a prediction using DDC data.
using 800 fpm/up & 1800 fpm/dn I show
a landing between Burdick with a 100k burst
to Harveyville with a 120k burst.

1779. Re: [GPSL] Lost signal from Project:Traveler

From: Ralph Wallio, W0RPK
Topic: 1772 Message: 1779

!00-120kft burst would have happened 15:45-16:15z. Traveler has landed or is close to it.

For DFing, the Pocket Tracker has a 10MHz crystal driving the PIC16F628 TT3 and an 8MHz crystal driving an MC145170 PLL.

Good info that we can use next time.

Now, if that pocket tracker comes to alive after hitting (or close to) ground, which happened on our last flight, then you'll hear white noise in the background at 144.34 MHz at the beacon interval (mine was set every 30 seconds so it was often enough). Too low to be decoded but still can be distinghuised from background noise.

We used this white noise last time to DF the payload (note, must ask all chase vehicles to stop beaconing their own on .34).
This white noise can be heard up 2-3 miles, and only when we're close to around one hundred yard we can start decoding the packet to pin-point the location. A TNC with Open-DCD mod for open squelch operation would be very beneficial in this situation.

Topic: 1769 Message: 1781

Thanks for all of your assistance in tracking. Here's the sequence of events.

Launch at 8:33am this morning in heavy winds. It was exciting, but it got off the ground with a 700-850'/min ascent.

Tracking was fine to just outside of McPherson. We lost all signal.

We stopped near 38 23.65N 96 57.72W and had a visual on the balloon at 10:35 at an estimated 80k. It appeared to be just slightly east of us and heading east. Unfortunately we made a critical error in trading a visual contact for a flushing toilet. We should have split company at that point, but we didn't. Oh well.

We arrived in Herington around 10:50 and were not able to regain visual, however cloud cover was increasing at that point.

By 11:20, we decided to stop and eat lunch before heading toward the predictions to allow the package to hopefully warm up and regain transmissions.

We drove to Council Grove area and split up scanning the area. Jon's vehicle wound up with two flat tires near Diamond Springs, and with only one spare, we were in a bit of a pickle. We finally got four "usable" tires on the van and limped it home after driving back down 57 to HW 50 and home. We never heard any packets.

That area is mostly open range with very few decent roads. There aren't a lot of farmers around there to find it during plowing or harvest either. We'll see what happens.

Thanks for all of your assistance...

Unfortunately there isn't much in airports in the area, and being such a small payload, I think it'd be virtually impossible to see from the air.

We toyed with the idea of going up to listen for RF this afternoon, but with the wind blowing like it was, we didn't figure two many light planes would want to fly. That and we weren't 100% convinced that there would be any RF to hear.

I hope there are lots of hunters that walk that area in the fall.....

That's happened twice with NX0G's PT on EOSS test flights. Methinks
a little power dissipation is not a bad thing for a balloon payload
that's gonna go thru -80C in the tropopause.

Unfortunately there isn't much in airports in the area, and being such a small payload, I think it'd be virtually impossible to see from the air.

I almost wonder if it isn't pressure instead of temperature. In daylight, most any payload will hold its temperature reasonably well. I've studied this on a number of NSTAR flights and on ascent the temps stay above -10C even with minimal insulation. The internal temperatures even increase as you exceed 60,000 ft or so.

Perhaps a component is going out of spec due to low air pressure. Failure at 30,000 to 50,000 ft seems to the common altitude for it to happen. If it were purely temperature I think we'd see more variation than we have due to insulation and solar heating differences. Perhaps a capacitor or coil on the PocketTracker has a problem at low pressure. I believe the PocketTrackers have been tested for cold, but perhaps not for pressure (other than various flights).

1788. Re: [GPSL] PocketTracker discussion

Yahoo group: GPSL (2002 — 2008)
Date: 2005-10-30 23:26:59 UTC
From: wb8elk@aol.com
Topic: 1788 Message: 1788

I've flown several PocketTrackers and have never had one fail on me during flight as long as I tune the VCO voltage to about 2.8 volts or so. I have had situations where something changes (baud rate or frequency?) so that my D7A and the D700 cannot decode the packets but my old KPC-3 still can....this can be corrected using the Calibration value on the PocketTracker setup. I did notice during a recent flight that I could decode better about 5 kHz higher in frequency when it was above 40k feet. This problem usually crops up above 40 to 50k feet and after that I only start to track it again on my Kenwood gear after it comes down through 20k on the return. Once the Calibration value is set for high altitude flight it usually isn't a problem. We did some testing by changing the Calibration value on the PocketTracker on the workbench and seeing how far it could be changed and still be decoded by various TNC's....the Kenwood D7A and D700 were very tight and unforgiving....the KPC-3 worked for a much wider range of values.

The only total failure modes I've seen is when the internal temperature drops below -40 after sunset (more likely due to battery failure) and also dropping them in oceans and rivers tend to cause them to fail....I've done this to 3 PocketTrackers now....the one that spent a week in the Tennessee River is all green inside but I haven't tried to power it up yet...the other 2 are in the Bermuda Triangle....I imagine there are some puzzled scientists in Atlantis trying to figure out what they are.

Well, that's a possibility. But there are no component packages
in the PT that are much different from those that we fly in other
beacons. I do note that the PT VCO is not shielded, unlike those
in every other synthesized radio I've ever looked into. So it's
possible that the VCO free-run freq may be affected by the presence
of the Altoids can lid. I don't think those cans are so well sealed
that the lid would bulge out during ascent, tho.

Just ran an empty Altoids tin up to < 10 mbar (6.5 Torr) in
the EOSS altitude chamber, watching for changes in light reflected
off the surface. Nada. I could run the same test on someone's PT,
but not with any real GPS sigs.

The PT's primary design feature is low power consumption. The only
power consumption while the PT is idle is the timer in the PIC --
that and the GPS receiver, of course. But those two boards are
not closely coupled thermally. And the VCO tank doesn't show any
evidence of positive tempco tuning caps to compensate for the
negative tempco of inductance as the copper coil shinks. And the
chips used are just commercial temp range (0 - 70C), I think.
The "balloon mode" VCO tuning procedure is to set the tuning
voltage higher than normal (higher free-run freq), evidently to
forestall bottoming out Vtune when cold.

This is why I suspect that it's temperature that's getting to
the PT. It might be instructive to log or telemeter the PT
PWB temperature during a flight. Just be sure to use a
non-self-heating transducer.

I know that this PT was not tuned using the Balloon Tuning Instructions.

I tend to agree that the failure was probably because of the PLL losing lock due to temp. The battery was a ?Lith-Poly? pack used by electric airplanes. It was a brand new pack that I believe was tested/cycled thoroughly on the ground. The fact that we suddenly lost comms and were never able to get even a trace of them back is really the only reason that I am keeping an open mind about other possible failures.

The capsule packaging was a new design for us, and had never been tested to sub-0C temperatures. I'm toying with the idea of building another package and cooling it down for comparison purposes. I'll post my results if and when I ever get around to it.. :-)

One thing to keep in mind, this was the first Project: Traveler flight to not have a single linear regulator on board. In a certain respect, I think that amateur ballooning has come to depend on inefficient circuits to provide self-heating.

Hi Zack,

The next question I was going to ask was about the battery you had flown on the PT...I typically use the Ultralife lithium 9-volt. Since you died out abruptly, here's a thought:

On my very first balloon flight, I suddenly lost power at around 50 to 60,000 feet...I was running Kodak lithium flat polymer batteries....one theory that was posed at the time was that the flat plastic batteries had expanded due to the vacuum and the cells had lost continuity....perhaps a good test would be to run that R/C polymer battery in a vacuum chamber like EOSS possesses and see what happens to it.

However, since you PT didn't have it's VCO compensated for balloon flight temperatures, then that's a good likelihood for your failure...I drill a hole in the Altoids tin so I can access the VCO tuning coil with the Altoids lid shut, otherwise it's almost impossible to adjust.

FYI - One cell of an Eveready 2CR5 vented/failed at
about 30kft on ORB-14 which led to the cutdown failing.

I have not tried another of these batteries.

We've flown these types of batteries before. I don't believe that there's anything inherently wrong with the type, however being a virgin battery, I could see possibly having some sort of defect in it that was pressure sensitive.

Hi Zack,

Yeah, a secondary motto for balloonacy might be "a little more heat".

What I find ironic about the excess of zeal that went into the PT's pea-power design is that the GPS itself consumes way more power all by itself than does a vanilla TT3 and DJC1.

Which opens the possibility of coupling heat from the GPS into the PT?

Hi Nikhil,

If you're trying to save money by reusing a latex after a tethered test, then it would be a lot safer to use a much smaller and cheaper balloon filled to near burst diameter for the tether tests, and use a fresh big balloon, like a 2000 or 3000 gram, which has not been damaged by handling and UV exposure for your free flight.

Per Liftwin 0.41, a 200 gm Totex could lift 16 lb and still leave 4 lb tension left on your tether line. Not sure the neck is strong enough to hold 20 lb, but if it isn't, you havn't lost much money, except for the Helium.

Hi Mike,

Thanks on your input regarding using small latex balloons. What I would ideally like to use is a plastic balloon , which can filled up with helium and sealed. Once I am done testing the plastic balloon, I would let the helium out and I could reuse the balloon for my next test at a later date.

any ideas?

Nikhil

Hi Nikhil,

See my off-reflector reply a bit earlier.

Bottom line: latex is tougher and a LOT cheaper than plastic, but
Robert or Mark might be able to guide you on how to roll your own
plastic. Note that the helium necessary to hoist 16 lb ain't gonna
be cheap! Might consider finding a place with a LARGE door that
you could store the inflated balloon in.

To the members of EOSS:

I want to send along my congratulations on making it to flight number 100...that's an amazing accomplishment and a testament to all those who have made EOSS into a successful 15 year institution. Another remarkable achievement is your 100 percent recovery record made possible by your well-organized mission control and recovery team members. I long ago gave up on achieving that kind of recovery record after dropping many payloads into lakes, rivers, alligator-filled swamps and the Bermuda Triangle.

I wish I could be there for the big event, however I will be following along vicariously via the internet.

Congratulations on your historic 100th flight and I will make every effort to attend your 200th !!!

Hello Bill,
Thanks for the good words and for starting this fascinating part of our hobby. Your support over the past 15 years has encouraged EOSS to move forward into new, brave technologies. Your support has enforced our enthusiasm for zealously promoting science through amateur radio and ballooning.

We regret that you could not make this event, but we know you will be watching - and enjoying...
- Marty

Hi Bill,

Sorry you couldn't make the Big Event, but we'll sure be thinking
about you as we reminisce about how the heck we ever got here!

And keep the faith, Bill. Every time we launch, we put that recovery
record at risk, and we KNOW that Murphy's been working overtime on
this one!

1806. Interesting alternative to a slingshot for retrieving payloads from trees

Yahoo group: GPSL (2002 — 2008)
Date: 2005-11-11 20:36:07 UTC
From: wb8elk@aol.com
Topic: 1806 Message: 1806

I just bought something called the "Cable Caster" from Home Depot...it was in their wiring/electrical department and is designed to launch line across false ceilings for wiring.

It works the same way as those kid's toy suction cup gun dart launchers only this one is on steroids with a fishing reel attached.

It will shoot the dart (attached to the fishing line) at least 50 feet straight up and perhaps a bit further and is very very accurate....just push the dart into the gun until it latches, release the fishing reel mechanism, aim and shoot.

Although it won't reach the really difficult tree landings that are 100 feet up....this is a great addition/alternative for those of us who are slingshot challenged.

It's made by Greenlee and is about $45 and comes with 3 darts and the attached fishing reel.

1809. Opinions on GPSL 2006 - I need some feedback

Yahoo group: GPSL (2002 — 2008)
Date: 2005-11-14 23:18:03 UTC
From: Zack Clobes
Topic: 1809 Message: 1809

As was decided over the past couple of months, GPSL 2006 will be held in Hutchinson, KS on the weekend of 4-6 August. We plan on following the traditional schedule of symposium on Friday (4 Aug), flight on Saturday morning, and a rain-date of Sunday morning.

Hutchinson has a brand new (more or less, it's a long story) convention center in town that is part of a nice hotel, and includes an indoor water park. (http://www.grandprairiehotel.com/)

I have contacted Grand Prairie regarding use of a conference room. It basically boils down $125 for the Symposium on Friday, assuming we eat a meal or two at the restaurant. The obvious choices for that meal would be the Thursday evening "gathering" and the Friday lunch.

"Group" room rates are $79 + tax per room night. This includes access to the water park as well as high-speed Internet. We would be expected to reserve approximately 30 rooms for Friday night.

Food prices a little on the high end - think Applebees + 20%, although the serving size is probably 20% larger also. And very good food I might add.

They've agreed to provide water, and allow us to supply our own candy dishes during the Symposium. There is the restaurant that is 100' down the hall, and also a pop and ?candy? machine on premises.

THE QUESTION IS, DOES THE GROUP WANT TO COMMIT TO SPENDING MONEY FOR THIS EVENT? I will keep prices as low as possible, but I'm toying with the thought of charging each flying group a ?$25? "landing fee" to attend the event.

1812. Sky Trek to the 'Near Space' Neighborhood

Yahoo group: GPSL (2002 — 2008)
Date: 2005-11-15 10:24:25 UTC
From: Ralph Wallio, W0RPK
Topic: 1812 Message: 1812

Sky Trek to the 'Near Space' Neighborhood
Space.com, November 9, 2005

Near Space is a region where few aircraft can tread. Floating high above the jet stream, lighter-than-air ships are now deemed as a way to loiter at length. They appear ideal for keeping tabs on a foe's troops or delivering telecommunications services to your own warriors.

From on-high, sensor-laden platforms might gaze at weather or monitor a huge expanse of airspace as part of a ballistic missile defense shield. Supporters of high-altitude platforms contend they can deliver services on a par with Earth orbiting spacecraft-at far lower cost.

General Lance Lord, Commander of the Air Force Space Command, touched upon emerging Near Space attributes at an October 20th Pacific Space Leadership Forum in Hawaii. Near Space is between 65,000 feet (20 kilometers) and 325,000 feet (99 kilometers) above sea level.

"The fact is space has transformed the modern battlefield. We are more precise, more efficient, and more combat effective because of space. We are also less destructive, less likely to inflict collateral damage, and less likely to go to war because of space," Lord said. "If you can tie it to a balloon you can get it to Near Space, our prototyping efforts with communication and imagery platforms [are] showing promise towards giving us a low cost persistent world-wide presence."

Trial runs

Lord's keenness was bolstered by Near Space demonstrations done earlier this year by the U.S. Air Force Space BattleLab at Schriever Air Force Base, Colorado. Tests of balloon-borne ground-to-ground and ground-to-air communications systems were staged to show the effectiveness of a low-cost, simple solution to meeting warfighter communication needs.

The trial runs involved balloon-borne SkySite command and control platforms developed by Space Data Corporation of Chandler, Arizona. Space BattleLab is now adapting this system to provide a platform for its Combat SkySat communications system, part of the laboratory's Near Space initiative.

Near Space is an altitude that is virtually unused currently - higher than planes fly, but below satellites. It is also a height that is above weather and most weapons systems that can do you harm, explained a BattleLab's statement on the tests.

In addition to this activity, also on the BattleLab's current initiatives roster is a Combat Sentinel Near Space and a Near Space Maneuvering Vehicle project.

Disposable spy ships

The Johns Hopkins University Applied Physics Laboratory in Laurel, Maryland is delving into unpiloted spy ships too, but of the disposable kind.

The High Altitude Reconnaissance Vehicle (HARVe) would operate in Near Space, staying in one spot for roughly two weeks to 30 days. It would supply to military officials on the ground 24/7 (24 hours a day, 7 days a week) coverage of select areas on Earth.

According to APL's Bob Behler, Precision Engagement's business area executive and the project lead, the HARVe would be ejected from either a cruise missile or possibly a reusable rocket. A second booster would propel the vehicle to about 300,000 feet above sea level, and then the ship would inflate and descend to hover over a target area at about 100,000 feet.

HARVe could carry out radar and imaging missions, protect and track friendly forces, appraise battle damage and carry communications nodes. After the two weeks to a month, the vehicle would either disintegrate or be destroyed.

Anchoring in the right location

"We see the use of high-altitude, lighter-than-air vehicles in the 70,000 to 100,000 foot range as a tremendous, real asset to communications, surveillance and target acquisition for the military," said Tom Millett, Executive Vice President of Millennium Airship Incorporated (MAS). The company's corporate offices are located at Bremerton National Airport in Port Orchard, Washington.

Millett said, however, that several significant problems need to be overcome.

"The primary one is the ability to recharge the air vehicle's power source," Millett told SPACE.com, noting that passive regeneration of batteries does not handle the electrical load required. "We have the ability to regenerate the air vehicle power through a laser source. While this system is still in development, it shows great promise," he added.

One other issue is anchoring the air vehicle in the right location. Within its proprietary technology toolbox, MAS has a very small position control system that could solve this issue, Millett noted.

As for the overall utility of high-altitude air vehicles, Millett said they would be cheaper to launch and maintain than satellites and could be placed in strategic locations very easily.

Numerous benefits

There are, however, several overall problems to be resolved-such as weight to be placed high above terra firma, durability of the air vehicle, power regeneration, and several others. But Millett said "we believe the benefits of high-altitude air vehicles are numerous and would be a very economical solution to communications over specific regions on the globe."

Millennium Airship has recently steered its design talents toward a "SkyFreighter". This heavy-lift, but lower-altitude flying vehicle is envisaged as augmenting the already burdened sea and air cargo business.

Other countries are eyeing large stratospheric airships too.

For one, an aeronautic research arm of the Japan Aerospace Exploration Agency (JAXA) is sponsoring the Stratosphere Platform Project. They see a network of huge unpiloted airships that stay afloat high in the stratosphere, outfitted with telecommunications gear and sensors. From their aerial positions, broadcasting, Earth observation, and disaster monitoring could be executed.

Service by "Stratellite"

Then there's Sanswire Networks, LLC, engaged in "out of the atmosphere thinking". The firm is taking their wireless broadband network ideas to new heights. Sanswire Networks is a wholly owned subsidiary of GlobeTel Communications Corporation of Pembroke Pines, Florida.

Sanswire is prototyping a High-Altitude Airship Platform. Called a "Stratellite", it would transmit various types of wireless communications services currently handled from cell towers and satellites.

A Stratellite airship is 100 percent reclaimable, utilizing proprietary lifting gas technology. A concept, company officials report, could be exploited for many military and government uses like secure communications, border control, Homeland Security duties, Earth remote sensing and surveillance, battlefield control, as well as climate research.

I am the Walrus

In August, the Defense Advanced Research Projects Agency (DARPA) awarded two contractors first phase dollars for the Walrus program-a heavier-than-air vehicle that produces lift through advanced breakthrough technologies in aerodynamics, thrust vectoring and gas buoyancy generation and management.

Lockheed Martin Corporation's Advanced Development Programs of Palmdale, California and Aeros Aeronautical Systems Corporation of Tarzana, California were granted roughly $3 million each in funds.

DARPA's Walrus wishes are to develop and evaluate a very large airlifter. In particular, Walrus is seen as moving loads of up to 1,000 tons across international distances. Supporters of the concept foresee a complete Army brigade carried by Walrus, right from "the fort to the fight."

Airship traffic

Given the fact that airship work appears to be on the rise-from lower altitudes all the way up to stratospheric heights-what about classes of these sky trekking airships able to transport rubbernecking tourists?

That idea hasn't escaped one team of architects. The hotel and resort designer group, Wimberly Allison Tong & Goo (WATG), has already sketched out

some thoughts on a comfy-looking airship hotel.

And back in 2000, a study group of the International Space University (ISU)-comprised of 40 young professionals from 21 nations-produced the report: Space Tourism -- from Dream to Reality. The study was done as part of ISU's summer session, held at the Universidad T?cnica Federico Santa Mar?a in Valparasio, Chile.

One of their comments was that high-altitude balloon flights carrying passengers could help generate public interest in suborbital and orbital jaunts.

1813. Balloon Sat 'kits'

Yahoo group: GPSL (2002 — 2008)
Date: 2005-11-15 15:07:08 UTC
From: kc0mic
Topic: 1813 Message: 1813

CAPNSPACE and Near Space Ventures are planning on hosting a couple of "Near Space" workshops next year. Does anyone know if there are 'kits' for a balloon sat that would have a modified or modifieable digital camera, timer, HOBO, etc.

If not does anyone have a recommendation for a reasonably priced digital camera that could become a 'standard' if we have to source our own kits. That would go for timers, sensors, data recorders, etc too.

Any ideas or suggestions would be greatly appreciated.

Thanks

73 de Troy, KC0MIC

Hi Zack,

The lecture hall at the college sure was a great venue for GPSL
'04, and it didn't tie any of the attendees to pricey accomodations.
Wouldn't that work again?

The $25 "landing fee" isn't an issue for EOSS, however.

I'll be staying with family, so the hotel isn't an issue for me. If the cost of the accomodations don't scare people away, they sound fine.

There are a couple of digital cameras at Wal-Mart that are reasonably priced and may be worth investigating for modification purposes. One is about $40 and is a 2Mpixel camera with no LCD display (obviously not a big deal for balloons). The other is $60 and 3 Mpixels with a display. I imagine they will be as easy to modify as the Concord 4060AF that several of us are using. However, I don't know of anyone who has modified one yet.

In the Wal-marts around here (Omaha metro), they are hanging on the wall next to the 1-hr photo section along with the SD/CF/xD cards.

I've also had thoughts of redesigning Paul's Basic Stamp 2 boards. I would include provisions for a MAX186 A/D converter and some EEPROM I2C chips on the same board. It might be nice to have a run of a couple dozen boards - I've used expresspcb.com with good results for their MiniBoard service and the cost would be $20/board (double-sided, no silkscreen, plated/tinned). This could be made into a standard kit (perhaps less the Basic Stamp) for a reasonable price.

We could talk to Parallax about a BalloonSat kit that uses the BS-2IC. I picture a kit witha controller like Mark indicated and a set of experiments that could be assembled by the buyer.

1818. Re: [GPSL] Opinions on GPSL 2006 - I need some feedback

Yahoo group: GPSL (2002 — 2008)
Date: 2005-11-15 20:31:18 UTC
From: Ralph Wallio, W0RPK
Topic: 1809 Message: 1818

I wandered through Hutchinson visitor information at www.visithutch.com for all of this.

The National Trappers Association Convention will be held in Hutchinson August 4-6, 2006. Several accommodations are already 100% booked including Econo Lodge, Comfort Inn, Best Western and Scotsman Inn.

Both Grand Prairie and Holiday Inn Express still have rooms available (but maybe not for long). The Holiday Inn Express room rate is competitive with Grand Prairie.

Conference facilities are available at the Grand Prairie, Holiday Inn Express, ESSDACK (an education services organization), the Hutchinson Community College Student Center and others. See http://www.visithutch.com/facilities.htm

I suggest negotiations with both the Grand Prairie and Holiday Inn Express. The Holiday Inn Express does not have food facilities so coffee, rolls, lunch, et al., could be catered for less cost.

Perhaps ESSDACK and the community college could be approached for appropriate space. The college has food service which might present a rough edge but it all worked out ok in Omaha.

One way or another we will need to make decisions and get rooms reserved ASAP because it appears the trapper gathering is a big deal.

Thanks Zack,

That would be a good start.

Maybe would we could eventually come up with is a base set of cababilites
(camera, a couple of sensors with a data recorder)
and then have "upgrades" (controllers, geiger counters, light sensors,
pressure sensors, etc)
Maybe have a 'science package' an 'amateur radio package' an imaging package, etc.

They would all conform (more or less) to the 1.2 pound 4-5 inch spaceframe model.

My biggest concern right now is to get a more or less consistent supply of cameras that can be modified somewhat easily. The target audience will be new to soldering.

I've sent an email to Partallax about this.

I suspect we'd leave things like camera mods out of the kit. So the camera would already come modified. But easier things I think should be left to the user.

I suppose we _could_ use a BS-2 to run the camera, rather than a timer. (I'm partial to the BS2-OEM rather than the IC. It's mechanically easier to deal with, the connections could be plugged onto the connector pretty easy, it's got an on board regulator that can supply other components too, though either would work. That would take care of the timer issue and add a _lot_ of flexibility for "upgrades"

For a classroom setting with 5-6 teams of 4-5 people and a regimented schedule, the camera is actually going to be the hard part. I'm looking for "all the same" so that we can at least have written instructions. I may just have to bite the bullet and see if I can get funding for 20-30 of them and count on having a different model every year.

PAUL VERHAGE <paul.verhage@...> wrote: I've sent an email to Partallax about this.

I suspect we'd leave things like camera mods out of the kit. So the camera would already come modified. But easier things I think should be left to the user.

Paul

>>> kc0mic@... 11/15/2005 2:56 PM >>>
That would be a good start.

Maybe would we could eventually come up with is a base set of cababilites
(camera, a couple of sensors with a data recorder)
and then have "upgrades" (controllers, geiger counters, light sensors,
pressure sensors, etc)
Maybe have a 'science package' an 'amateur radio package' an imaging package, etc.

They would all conform (more or less) to the 1.2 pound 4-5 inch spaceframe model.

My biggest concern right now is to get a more or less consistent supply of cameras that can be modified somewhat easily. The target audience will be new to soldering.

Paul

>>> n9xtn@... 11/15/2005 12:41 PM >>>
There are a couple of digital cameras at Wal-Mart that are reasonably
priced and may be worth investigating for modification purposes. One
is about $40 and is a 2Mpixel camera with no LCD display (obviously
not a big deal for balloons). The other is $60 and 3 Mpixels with a
display. I imagine they will be as easy to modify as the Concord

4060AF that several of us are using. However, I don't know of anyone
who has modified one yet.

In the Wal-marts around here (Omaha metro), they are hanging on the
wall next to the 1-hr photo section along with the SD/CF/xD cards.

I've also had thoughts of redesigning Paul's Basic Stamp 2 boards. I
would include provisions for a MAX186 A/D converter and some EEPROM
I2C chips on the same board. It might be nice to have a run of a
couple dozen boards - I've used expresspcb.com with good results for
their MiniBoard service and the cost would be $20/board (double-sided,
no silkscreen, plated/tinned). This could be made into a standard kit
(perhaps less the Basic Stamp) for a reasonable price.

Topic: 1809 Message: 1823

The venue sounds fine to me, and $25 per group flying is pretty reasonable. Room rates are also OK - you can get cheaper, but having broadband Internet in the room is a definite plus. The water park may be nice for those bringing families.

Will we have wireless (or wired) Internet in the conference room? That was a big plus at GPSL 2004. The only downside to using the college was having to drive a ways for lunch - having lunch in walking distance sure is handy and saves time/hassle.

Will we be required to guarantee 30 rooms from GPSL attendees and X meals at the restaurant? I imagine lunch is no problem, but some folks may plan to arrive relatively late Thursday and would miss the evening meal.

I need to iron out some details on the numbers. She did not leave me with the impression that we'd have to guarantee the rooms, but that is yet to be seen. My opinion is that we're paying enough for the rooms as is, there shouldn't be any requirements. There is Internet in the conference room, but I forget if it was wired or not.

I know that we can get cheaper rates by shopping around, however I see that we gain several things in this scenario:
- An "official" hotel for everyone to stay at.
- Entertainment for spouses and children
- No traveling for lunch Friday which means more time for the conference
- Easier access for people arriving Friday during the day - they can check in and walk down the hall to the convention.

I can certainly check into the Juco again this year, but I think the group has out-grown most of the other possibilities around Hutch.

1825. GPSL 2006 Survey

Yahoo group: GPSL (2002 — 2008)
Date: 2005-11-15 23:19:16 UTC
From: Zack Clobes
Topic: 1825 Message: 1825

Please return one survey per group. Approximate numbers are fine - I just want to get a feel for the group. A more official form will be available early next year.

Name of group:

Number of members attending Friday's symposium:

Number of members attending Saturday's launch:

Number of hotel rooms needed Thursday night:

Number of hotel rooms needed Friday night:

Number of hotel rooms needed Saturday night:

Do you have spouses and/or children that would attend assuming we had kid-friendly entertainment Friday:

Number of helium tanks needed (K/T sized):

How many two meter APRS transmitters do you plan to fly

Do you have any other special requirements for flight?

That's the general idea. I got appointed the state Director of Aerospace Eductation. As you might guess, I'm going to go lean heavily on the 'space' portion of those duties, hopefully in conjunction with the Missouri Space Grant Consortium. I'm just trying to get all the duckies lined up and quacking in unison before I try to publish a schedule.

1827. GPSL 2005 CD and DVD

Yahoo group: GPSL (2002 — 2008)
Date: 2005-11-16 03:57:58 UTC
From: Mark Conner
Topic: 1827 Message: 1827

At long last, I finally got the pictures, presentations, and video assembled. I've burned the first batch and will be labeling and mailing them as I get time over the next couple of weeks. I plan to send one set to the head honcho for each balloon group that participated, plus some others who were key players in GPSL 2005. If you're with a balloon group that flew at GPSL 2005, please ask them for a copy of the disks.

Once I get this batch labeled and mailed, I'll be taking requests from others. Thanks to all who contributed photos and video.

Here's a more complete rough guess for the WB8ELK contingent:

Name of group: WB8ELK

Number of members attending Friday's symposium: 4

Number of members attending Saturday's launch: 4

Number of hotel rooms needed Thursday night: 2 - 4

Number of hotel rooms needed Friday night: 2 - 4

Number of hotel rooms needed Saturday night: 2 - 4

Do you have spouses and/or children that would attend assuming we had
kid-friendly entertainment Friday: 2

Number of helium tanks needed (K/T sized): 2

How many two meter APRS transmitters do you plan to fly 2

Do you have any other special requirements for flight? 439.25 or 434.00 ATV

imaging package, etc.

You might want to glance over into the Balloonatics group. A
couple of us have been kicking around various sensor ideas a bit.

Radiation counting would be interesting, although you might be
better off going with a scintillation counter rather than a
Geiger-Mueller (GM) tube, since GM tubes are rather insensitive
to gamma radiation, which is what most cosmic rays are. They're
good for counting beta particles, and they do respond somewhat
to other radiation (alpha, gamma). Another problem is that the
Halogen based GM tubes may not function well at extremely low
temperatures due to the Halogen gas (Chlorine, Bromine) condensing.
At least test it before flying it.

Light sensing would be interesting, especially if you could add
some narrow band spectral filters to determine how the spectral
composition of the light changes. That might be especially
interesting if you could also do infrared and doubly so for
ultraviolet.

Sensing the atmospheric temperature would be interesting, as well
as the pressure. Something else that might be interesting would
be to see if you can determine atmospheric composition by
measuring the speed of propagation of sound or something along
those lines (Does the relative amount of Oxygen, Nitrogen,
Carbon Dioxide, etc. affect the speed of sound in air?).

Another idea would be to perform a particle capture experiment
to see how much dust/debris/etc. are floating along at altitude.
Could you use a fan with a piece of filter paper?

Some of the other ideas we've kicked around have been using a
strobe light on the payload as a QRSS data transmitter (as well
as making it easier to optically track the balloon/payload).

We've also mentioned the possibility of using a foil type of parachute to achieve steering during the descent phase of the flight.

There has also been a bit of discussion about cut-down circuits.

And, some discussion touched on exploiting the colour of the payload package to determine solar heating rates (More thermometers/thermisters/etc.?).

Then, you could always mount a magnetometer (Hall effect sensor? PPM?) to determine any shifts in the Earth's magnetic field with altitude. If you have the power and weight budget, you might even try magnetic steering/stabilization (although that's a pretty long shot).

Vibration sensing might also return some interesting data, especially across a several different flight configurations to determine stabilization techniques.

I'm sure the list of sensors are as long as our imaginations are.

> They would all conform (more or less) to the 1.2 pound 4-5 inch spaceframe model.

The biggest problem will be carrying everything you'd like within that weight budget. Maybe the best solution would be to make the science package as flexible as possible.

> My biggest concern right now is to get a more or less consistent supply of cameras that can be modified somewhat easily. The target audience will be new to soldering.

Cameras are nice. :-)

Zack, I'm not sure I understand what you are asking.
Are you saying $25 per group to attend the Symposium
or to launch?

Here is a reply, to your question, sent to me:

********** Text to Post Follows **********

Don, there seems to be a discussion of the E-group
about charging a "landing
fee" for each team to offset the cost of renting a
high price room in a fancy
motel in Hutchinson. I would like to get my opinion
posted to the group.

It seems to me that the symposium held on Friday and
balloon launch on
Saturday are separate events and each should stand on
their own merits. If extra money is needed for the
room to hold the symposium then those attending the
symposium should "Pony Up" something $5 a head to pay
for the room.

Why should the entire launch team pay for something
they may not be able to
attend ?
Later - Nick
K?NMS
WPWG368

******** End of Text **********

From: Mike Manes
Topic: 1839 Message: 1839

Hi Guys,

There's a CAP group that has done some ballooning out here in the midwest going by the name CAPNSPACE (as I recall). They can prolly tell you how they integrated ballooning in with CAP ELT chasing.

Pretty sure they're up on one of the more popular email reflectors, which I've cc'ed to this email.

And all comers are more than welcome to come out to any EOSS flight to learn more about the operations both from a launch and tracking & recovery standpoint. Let us know if you have a payload you wanna fly - we usually have a lb or so of spare payload budget on most of our flights.

Gunner,

We've been doing ARHAB launches with CAP practice beacons (121.775 mhz) for about a year. We got an FAA tech that was going to discard an ELT to donate it instead, installed a new crystal and had it tuned and alligned. We only use 6volts on it so it doesn't put out the same wattage as even the practice beacons that squadrons' use.

It's a great way to get cadets involved in the Near Space program and is a Very good backup for recovery ops. We primarily use APRS but have a 2 meter voice beacon and the practice ELT . In the future, maybe we'll get the Wing to coordinate a SAREX with us and they can use an aircraft for recovery.

Let me know if you want more information on using them. Surprisingly (to me anyway) you can get a good elevation with an ELPR and we have had one 'find' using only the ELT.

I also have a copy of Lally's paper about RACOON balloons (long-ish duration zero pressure) around here somewhere... I'll post it to the web when I have time. (I thought I had come up with a great new idea in long duration ballooning last year - until I read this paper!)

-------- Original Message --------
Subject: [Ballooning] 20 meter beacon for long duration balloons
Date: Wed, 30 Nov 2005 21:34:39 -0000
From: "Steve Usary" <W3RFA@...>
To: Ballooning@yahoogroups.com

I've been working on a 20 meter BPSK beacon to act as a light weight payload for longer duration balloons. The total payload weight is 12 oz. including beacon, GPS, HF antenna, solar cells and short term energy storage for burst transmissions.

This will only transmit during daylight hours but a Battery can be added for night time use.

Total output power is 1 watt PEP. It transmits a BPSK31 string that is the same format as an APRS message except for the check sum format. The initial frequency will be 14.069 MHz, just below the PSK band.

It is capable of using the GPS output to correct the transmit frequency to within +- 10 Hz. Initially I plan to transmit a 25 second beacon every 5 minutes. This will allow 10 different beacons to use the same frequency since each one will be assigned a 30 second nonoverlaping timeslot.

No batteries are needed for daytime use and the expected life is unlimited (except for UV degradation of the solar cells).

The initial prototype should be ready in a month or two. It consistes of three PCBs mounted togather.

After I check out the prototype I will order the 3.5" X 3.5" PCB that will incorporate all parts on one PCB. This is a 4 layer PCB and has manufacturing setup costs of $140 and then about $20 per board, so it makes sense to get as many as possible.

I'll be setting up a web site in the future to post my progress.

Anyone interested in participating or making suggestions please drop me a line here or at w3rfa@....

Steve, W3RFA

IIRC that's the top of controlled airspace, so maybe that's their
measure. I'd always heard NS was around 100K+.

FWIW When I was at the X Prize Cup in Las Cruces, an
official of the state of New Mexico informed me that
'space' is now legally defined as anything over 60k
feet. In that state. Don'cha love the arbitrary
laws of mankind?

- KMC ng0x Denver (wondering if ANSR or EOSS will be
the first amateur group to put a latex balloon into
'space'.)

Well, in the US anyway, the FAA's jurisdiction tops out at FL600
(60K' pressure altitude). If "99%" means anything, then 100K', with
its ambient baro pressure of 10 mbar (1% of std MSL), then I guess
I'd have to say that the environment at 100K is 99% - >real< near -
of outer space. About the only orbital ambient condition that we
can't duplicate to 99% accuracy is microgravity, but we would if we
could get into a 17,000 kt jet stream :=}.

Quite a few: http://www.slate.com/id/2107381/

80 km, 100 km, 600 km, take your pick. Even the FAI Secretary
General called the 100 km choice "fairly arbitrary." The UN Office
for Outer Space Affairs doesn't name a number, "There is no agreement on
the limit of outer space."

Imagine how kewl it woulda been to have had a marine T&R team on site
near the forecast landing site during the descent phase! Would they
use a fish net in lieu of a bushel basket?

The PR team deserves a lot of credit for having mastered the bouyant
payload technology. Kudos!

And this was not the first maritime recovery for that team. Oscar KP4RF
showed some pix of a recovery just offshore from San Juan during his
visit at the Workshop flight this summer. But this one was well over
the horizon.

Hi,

Bellow is a short summary sent to TAPR by Hector N1TKK witch is my
tracker
director of our recent flight of December 3, also is he page updated
http://www.aprspr.net/balloon/kp4rf/. As soon we process the pictures
they
will be on the site. We are working on it.

73,

Oscar KP4RF

==
Hi Everyone

I just wanted to fill everyone in on a great APRS story, probably a
first for APRS. A little background, My name is Hector - N1TKK and I'm
a member of the Puerto Rico Space Grant Consortium. Our group consist
of teacher, students and Ham Radio Operators to launch and recover
balloons for 2 schools Marcelino Canino Canino Middle School in Dorado
and the University of Puerto Rico (UPR) in Rio Piedras. The hardest
part for us is recovery because we live in an island that is roughly
100x35 miles.

Yesterday the group had their 4th launch we were going to try to reach
burst (90k+ feet) altitude flight but winds predictions were starting to
shift the night before. Our choices were to cut the payload at around

30k feet, this would land around Canovanas City, this was a great/easy recovery area. 40k feet was going to land in "El Yunque". El Yunque is a Rain forest, lots of trees, some as 100' high, water fall, you get the idea :). The rest would land it in water between the east coast of Puerto Rico and the island of Vieques. We opted the safe altitude of 30k'.

At cut-off altitude unfortunately we encounter an interference (a link that we didn't hear before) so we weren't able to cut it so we had to let it fly. As predictions said it landed on water between the islands. The flight reached around 95,000 feet altitude. Once we arrived at the coast we spend the afternoon trying to get a fix on the location. We were able to hear a signal between S1-S3 but we weren't able to decode any packets to get the GPS info. Doing some DF we knew the direction were the payload was. We stop hearing the beacon around 2pm. We keep going to different parts of the coast to see if we could hear it but no luck. At around 6pm a local vendor in one of the peer told us he saw 3 Police boats going to an area were he was something land with a parachute. He told us were their office was, so we started to head that way hoping to hear a signal thinking they had it.

When we arrived, we heard nothing and the confirmed it they didn't run or received any reports of the payloads. The officer on duty was familiar with balloon payload because they have come across NWS and Coastguard dropsone, they have either found or recovered. The officer on duty wanted to help but he was alone (It looked like he had a boring day and he needed some action). He called a fellow officer that had just left to see if he could returned. He had every thing setup then another higher officer came in and wasn't sure that we should go out. After the officer convinced him that we had GPS position, had radios that would give us locations once were close. He reluctantly agree.

Now the good part, it wasn't until around 6:30pm (night time) that 2 officer, Oscar Rest KP4RF, Omi WP4DM and myself. We started to head to the last GPS fix under one condition. Because the weather conditions were still a little ruff (we have been under surf advisories until 11am that morning) they were going to try to get there but if conditions got worse we would have to abort. The ride was a bit choppy, 15 mins into the ride I was beginning to get worry I wasn't hearing anything, not a peep. But then out of nowhere a packet burst, it's alive, It's alive. We were screaming did you decode it to each other. But again no packet data a couple of minutes later finally a decoded packet, but as Omi started to read the coordinates off, wait that can't be right we are too far off. Then the next packet came in as he read the coordinates off, yes that's much better. But once we finally got there under the rain we saw:

http://www.aprspr.net/balloon/kp4rf/flight4/IMG_6865b.jpg

YES we finally found it around 7:15pm after 8hrs of search. So as you can see APRS did it's job a couple of miles out to sea (you can make out

some light from the coast in the picture), we impressed a couple of Police Officers from the Marine Division, everyone was happy specially the students, now we await to get the photos/telemetry from the payloads.

73
Hector.

1858. Summary data of 100 balloon flights

Yahoo group: GPSL (2002 — 2008)
Date: 2005-12-05 11:50:39 UTC
From: Rick von Glahn
Topic: 1858 Message: 1858

Edge of Space Sciences, Inc. has been flying for 15 years and we just launched and recovered our 100th flight last month.

As webmaster of EOSS, I've become a sort of de facto keeper of the data. Periodically I have posted a summary of flights to our website. With the completion of our 100th flight I decided it was time to expand our summary page with a few additional graphs and data.

http://www.eoss.org/ansrecap/overview/flight_history_1_to_100.htm

Included on this page is a description of the spread sheet of data available for all flights which includes 34 fields of information. In the early days we didn't keep quite as comprehensive a record of each flight as we now do, but it was surprising just how much information could be mined from various sources. The spread sheet is available in two formats, Excel 2003 and a plain text CSV file. The Excel file contains all the graphs seen on the website.

I'd like to thank Mike Manes, W5VSI, Merle McCaslin K0YUK and Marty Griffin WA0GEH for their submission of LOTS of information on early flights I seemed to have lost. Mike even had telemetry files from EOSS-030 and 31 which have both been added to their respective recap pages as well as incorporated into the summary data. I'd also like to thank Nick Hanks N0LP for his help and great ideas on what data should be added to this spread sheet to make it more comprehensive.

73 -- Rick, NØKKZ

US Airforce used 50 nautical miles for astronaut wings criteria, a la X-15. I've also heard the armstrong line ~45k feet defined as 'space'. Rationale for that was that you'd need a pressure suit above that altitude, an O2 mask just doesn't cut it. I think I broke 45k on a long haul 747 once..... but it really didn't make me feel like I've been to space.

The more I think about it, the more I like the New Mexico 60,000 foot definition. It's the law. All of the other definitions I've seen are less formal.

Personally, altitudes lower than what a satellite can orbit at are lower than space to me. So about 100 nautical miles altitude.

I can support the Armstrong line as being the boundary for space. The air pressure is low enough there that your blood will boil if you're unprotected. But, I believe it occurs at an altitude of 63,000 feet. In the past, I've used the 75,000 foot altitude.

I'll dig up my write up on my justification for the boundary of near space.

1867. Univ of TN Knoxville 20 meter balloon still transmitting

Yahoo group: GPSL (2002 — 2008)
Date: 2005-12-11 03:14:03 UTC
From: wb8elk@aol.com
Topic: 1867 Message: 1867

UTARC sent up on Saturday a small 20m 1-watt CW transmitter to test out their HF circuit before their big flight next weekend....I estimate it landed just east of Wytheville, VA.....they've received numerous signal reports from across the country and they think it'll still be transmitting for most of the day on Sunday..many reports have come in well after it landed so it more than likely is in a tree with the dipole stretched out nicely...if you hear it (kinda drifty and chirpy CW on 14.328 MHz)....send a report to the list here and also fill out the reception form on the UTARC website: http://www.utarc.org.

The CW message is AA4UT/b...followed by battery voltage and QSL info.

Topic: 1868 Message: 1868

Hi Bill,

It is 1740z 121105 and I am hearing CW on 14.328
in Tulsa, but very weak and un-copyable. I only
managed to copy an A and a B. I'm using a TS-130S,
MFJ Signal Enhancer II and a Cushcraft R5 @ 20ft.

The following report is from Jim K5LAD in Owasso, Ok.
The time of his report was 1400z.

Harry --
After I got your note last night I listened but the 20 meter
band was dead.
This morning when I got ready to check into my QCWA net
on 80, I turned the rig on and the receiver was sitting on the
20m freq. I heard the beacon sending AA4UT/B in a slow
and shakey tone. That was at 8AM. Signal not too much
above the noise but it's there.
Jim

1870. WB8ELK Balloon now floating at 61,700 feet

Yahoo group: GPSL (2002 — 2008)
Date: 2005-12-17 23:32:34 UTC
From: wb8elk@aol.com
Topic: 1870 Message: 1870

The Sun went down and the balloon stopped ascending and has now leveled off at 61,700 feet and appears to be happy there for the time being....it will probably track across Virginia...go over Richmond and out to sea....it's currently northeast of Knoxville, TN...over 200 miles downrange.

My latest landing site prediction: The Bermuda Triangle.

It's -46 deg. C inside the payload and it still is working.....also the 50 milliwatt beacon on 146.565 is still operating (update - it just died out at 5:18 pm CST but the APRS packet is still working)...it is using a 9-volt lithium with only 3 layers of bubble wrap for insulation...it's amazing that it still is operating.

- Bill WB8ELK

60k has always been a magical number for "floaters", I assume because of
the whole concept of controlled vs. uncontrolled airspace.

Being exempt and all, is there any real significance to this number?
Would there be a real problem with a floater that was at 50k?

1872. East Coast stations please listen in the morning (Sun) for WB8ELK balloon beacon

Yahoo group: GPSL (2002 — 2008)
Date: 2005-12-18 03:30:44 UTC
From: wb8elk@aol.com
Topic: 1872 Message: 1872

My estimated flight path from the last packet signal at 5:48 pm CST (near Kingsport, TN) indicates that the payload may fly out to sea east of Richmond, VA and at sunrise may be about 200 miles offshore.....at sunrise, it will be within 200 miles of the following locations: Philadelphia, NYC, Boston, Wash DC and may also be heard from Richmond or Virginia Beach, VA.

There is a chance that the balloon beacon on 146.565 MHz FM (WB8ELK - audio CW - on for 18 seconds and off for 12 seconds) may come back to life after the sun warms it up....also, the packet may start to work again as well - WB8ELK-11 on 144.39.

The balloon will stay up several hours after sunrise until it hits peak altitude so anyone that can monitor Sunday morning (or even afternoon), please email me if you hear anything from it.

VERY cool flight Bill!

192 mph is pretty darn cool!

There is a balloon group in the Southwestern US that
may put up a couple of small plastic floaters before
the end of the year, designed to float at about 35k
feet. It will be interesting to see how that mission
works out. Might land in your backyard.
But I like what you're doing with latex. Definately
cool to see how your winter flights work out. Thanks
for sharing them!

- Mark Caviezel, NG0X Denver (an advocate of a
mission a 1/2lb dissolvable alka-seltzer ballast
weight on long string..... Descent to ocean surface
results in a relaunch.... in theory... would be fun
to try)

1877. 35k foot floater? was RE: [Balloon_Sked] WB8ELK balloon still al ive southeast of Halifax, Nova Scotia

Yahoo group: GPSL (2002 — 2008)
Date: 2005-12-18 17:57:05 UTC
From: Rochte, Robert
Topic: 1877 Message: 1877

>I wouldn't pick 35K for a floater.

Really? And the hundreds of floaters used in various Lagrangian studies over the years floated at what altitude? Are you going to say, "above 60,000 feet"? No, I didn't think so...

Payloads that fall under the FAR 101 exemption are exempt for a reason - that is, because they are relatively harmless to commercial aviation. They are not exempt only above controlled airspace - they are exempt, period. And yes, they still must not "create a hazard" (101.7), but it's pure imagination that defines a 35k foot floater as a "hazard" and yet considers a flight with dual six pound payloads ascending from ground to 110k feet as safe.

Simply put, there is no legal or ethical reason to not fly a tropospheric floater. The only ones that tend to object are those obsessed with "playing NASA" and making AHAB out to be more than just a hobby or (at best) educational activity.

Not meant as a flame, but I guess the concern is that it we keep our balloons above the average flying altitude of aircraft, we stand less of a chance of someone seeing them or making comments on them. Anything that reduces the chances of the FAA even thinking of us is to our best interest.

>>>> Zack: I think the ~62k initial float altitude of Bill's balloon was a case of "that's just the way it worked out". It is very interesting how he gets the performance from latex balloons which are so dramatically different from the vast majority of other latex users.
Looking at the aprsworld data, looks like 42k feet would have been the 'optimal' altitude for Bill's flight yesterday, it was hauling at over 185 mph between 41k and 42k feet. That is, optimal to go somewhere. For an FAA part 101 exempt flight, there is no obligation to report the balloon position as the FAA presumably does not care about the affect of exempt flights on other airspace users. Literally hundreds of RAOB balloons are launched every day by NOAA often from sites near to busy airports with no attempt to re-route air traffic away from the sondes. In decades of doing this, the first ever airstrike just occurred about a year ago. With no damage to the jetliner AFAIK.
And in fact much heavier missions are easily accomodated by the FAA with proper co-ordination. Example: the 152 pound "ES-OS SEVEN" mission floated at 39k feet before it was commanded to terminate its float. There are a portion of ARHABers that will comment on the inadvisability/danger of someone else's exempt mission while making no attempt to cease their own exempt and non-exempt activities. Seems ironic.

Gonna slip into some asbestos long underwear about now.

1883. Radar transponder?

Yahoo group: GPSL (2002 — 2008)
Date: 2005-12-18 19:53:00 UTC
From: John C Nordlie
Topic: 1883 Message: 1883

My appologies if this has been covered before (I couldn't find anything in the archives), but one of the things our group at UND has been trying to find out is the availability of some sort of radar transponder that could be flown on an amateur balloon.

All the commercial ones we've found are too heavy and/or too power-hungry and/or too expensive to put on our payloads. It seems to me that with the state of the art of electronics these days, it shouldn't be a huge task to design and build a transponder that would be compatible with the FAA's radar system (although GPS altitude would be better for us than the normal barometric altimeters used in present models).

I realize that it's economies of scale that bring down the prices of things like radios and computers, and the market for such transponders might be too small for any company to be interested (I'd think balloon groups and possibly ultra-light aircraft operators would be the only takers). If the unit had to be FAA certified it would also drive the cost up and be rather daunting to developers, but that's somewhat questionable since none of our balloon carry passengers. Probably the biggest issue is that it would transmit on a non-amateur frequency.

Progress has been made with things like findu.com to allow position info to be accessable directly by ATC centers, and those who have worked to make this possible are to be commended, but I get the feeling that we'd make the most friends, or at least remove the most objections, if we had something that integrated into their system directly.

To clarify: no one including the FAA has asked us to do this, I'm just exploring the idea.

Thanks for your time, and Happy Holidays.

Terra used to make a radar transponder that weighed about 1.5 pounds...TRT150 I believe was the model and it was designed for the glider market or small aircraft. I could be powered with lightweight batteries as well....however, they discontinued it and later models were too heavy and power hungry.

The TRT-150 was used in a couple of flights from Utah years ago with good results.

I would agree with Paul, keep it above their realm and all will be
fine. Problem is that you need to provide some external heat source to
keep the equipment going. Problem is that the balloon probably dropped
down below 50 K overnight but that part of the flight did not report back
due to the internal temperatures.
Bill's package stopped working when it got down to -50C inside the
package. I thought of using one of those chemical thermal wraps but Bill
pointed it out that they use oxygen to make them work. I would think that
a little air might keep it from getting down to the point that electronics
would still operate and keep the batteries somewhat operational but since I
am not sure of the chemicals used to create the heat I would also be
concerned that any gasses released might attack the electronics or corrode
traces. Would anyone know what they use in the

I got cut off. The question is " would anyone know what they use in the
over the counter heat sport wraps"?

1887. Amateur Television Quarterly

Yahoo group: GPSL (2002 — 2008)
Date: 2005-12-18 22:35:37 UTC
From: Gene Harlan
Topic: 1887 Message: 1887

Time to think about articles for the Winter 2006 issue of Amateur Television Quarterly. Deadline is January 1st, but earlier is nice.

Not to late to get a subscription to ATVQ for Christmas. I had to laugh yesterday at one of the large retailers with the ad titled "Last Minute Holiday Gifts" and one of the items was a large box of garbage bags. A subscription to ATVQ would me much better, or other items from our web site (CD of ATV Secrets, cameras, tripods.....) or use www.hampubs.com to find our fine advertisers under the ATV section. Good for gifts or just for yourself anytime.

Check out the video cameras at http://cameras.hampubs.com .

Merry Christmas!

1888. WB8ELK floater - altitude vs. time

Yahoo group: GPSL (2002 — 2008)
Date: 2005-12-18 22:41:57 UTC
From: Mark Conner
Topic: 1888 Message: 1888
Attachments: 2 described; binary payloads are missing from this source WARC

I graphed the FindU reports with Excel - a very definite and sudden stop to the ascent in the evening, and two distinct ascent rates in the morning prior to burst or whatever happened Saturday morning. Very peculiar.

1890. WB8ELK HiBall-6 balloon and payload details

Yahoo group: GPSL (2002 — 2008)
Date: 2005-12-19 02:27:31 UTC
From: wb8elk@aol.com
Topic: 1890 Message: 1890

HiBall-6 Flight data:

Launch: UAH NSSTC at 2027z on Dec. 17th
Ascent rate until float: 500 ft/min on average.
Float occurred at sunset at 61,700 feet northeast of Knoxville, TN

Downrange travel to LOS at 37k feet: 1414 miles (270 mi SE of Halifax)
Flight time: 19hrs 32min
Peak Alt: 111,449 feet

Balloon: 2000 gram Scientific Sales latex weather balloon
APRS Payload weight: 1.5 pounds
Tracking Beacon weight: 4 oz
Total flight train weight including 3 foot parachute: 1 lb 15 oz
Total nozzle lift: 2lb 9 oz for a total of 10 oz free lift

APRS payload (WB8ELK-11): Opentracker APRS board, Garmin GPS-18LVC, Alinco DJ-S11T
Beacon payload: Doppler DF Systems Microhunt Foxhunt circuit...50 mW FM (audio CW).

Batteries: 6 AA lithiums to power APRS board and GPS
3 AA lithiums inside the Alinco DJ-S11T

9 volt lithium powered the Beacon

73s de Bill WB8ELK

1891. 20m QQRP CW Beacon

Yahoo group: GPSL (2002 — 2008)
Date: 2005-12-19 17:03:10 UTC
From: Harry M
Topic: 1891 Message: 1891

The 10m Beacon is off the air.

I now have a 20m beacon on 14.055 +/-
It will be on the air for several days.
QSL reports are appreciated.

73 Harry

1892. WB8ELK 50 mW balloon beacon was heard in Maine during flight

Yahoo group: GPSL (2002 — 2008)
Date: 2005-12-19 18:17:35 UTC
From: wb8elk@aol.com
Topic: 1892 Message: 1892

I just received this report which answered my nagging question as to whether my 50 mW beacon on it's 9-volt battery had thawed out as well...I believe he's over 360 miles away from where the balloon was.

73s de Bill WB8ELK

Signal report:

Thought you might be interested in the following: Last Sunday, 12-18-05, I had my 2 meter rig on scan and it locked up on 146.565, which is the freq the local hams use simplex.I first thought some one was sitting on their key! It was an S 2 sig. Then I heard cw which was weak but Q5.It was sending "kb8elk balloon ar" I copied it from 0745 to 0930 EDT.My home qth is Hancock,Me, small town on the NE coast of Me, approximately 30 miles East of Bangor, Me.When I wascopying the sig I was at Winter Harbor, Me, small town just East of Hancock. At that location I was using a home made ground plane in the attic.Just thot you might like to know!

1893. > 5. Radar transponder?

Yahoo group: GPSL (2002 — 2008)
Date: 2005-12-19 21:59:29 UTC
From: K. Mark Caviezel
Topic: 1893 Message: 1893

John:
I'll be following up on Bill's suggestion, but if you find anything different or better, I'd love to hear about it. I am itching to equip my hot air balloon with a transponder for those really high flights. Everything I have found so far (except the Terra 150 that Bill mentioned) is at least 3.5 lbs, current gobbling 1.2+ amps at 14V. I talked to an application engineer at Bendix/King today and he mentioned that the 35k foot limitation on the 76A was due to ambient cabin pressure so as to avoid arc'ing things out. Yeah seems odd that even new design transponders are heavy power pigs. The transmitter is 200 or 250W but only transmitting for microseconds, so average radiated power is low.

- KMC

1894. Re: [GPSL] > 5. Radar transponder?

Yahoo group: GPSL (2002 — 2008)

From: Zack Clobes
Topic: 1893 Message: 1894

For a 200+W output, 1.2 amps doesn't seem all that excessive. :-) I suspect a small portion of the current drain is going to what balloonist would consider useless stuff like back-lighting and display.

One thing to consider is that just because you can get a 3 pound transponder, that doesn't mean your out of the woods yet. You still need a blind encoder to convert the _pressure_ altitude (not the absolute altitude that you get from a GPS receiver) to a digital "gray-scale" signal. Secondly, a traffic controller always want the aircraft that he is communicating with to be using a unique 4-digit code (squawk code). I suppose that this could possibly be arranged prior to launch, but I think it's probably more practical to have some method by which to change that code in flight. Lastly, you'll need an antenna capable of handling 250W at 100k feet - not a trivial task in and of itself.

As for the arc'ing, that doesn't especially surprise me - all of the transponders that I've played with all use a high-voltage vacuum tube for the RF final.

Call me a pessimist, but I'd have to say that unless someone was to account for ?10lbs? of transponder on their flights, having a radar return is probably out of the scope of amateur ballooning. Building our own would probably be out of the question. It would have to be a type-accepted FCC transmitter, FAA approved encoder, piece of mechanical and electrical engineering marvel.

1895. Re: [GPSL] > 5. Radar transponder?

Yahoo group: GPSL (2002 — 2008)
Date: 2005-12-20 00:57:37 UTC
From: wb8elk@aol.com
Topic: 1893 Message: 1895

The Terra TRT150 had a thumbwheel display so no need for unnecessary display current drain....I believe that the balloon ID code was always requested to be 1200. I'm not sure, but I believe that the altitude encoder wasn't a requirement for a balloon as I recall, they just liked to know it's position. I believe Gil Moore would have more info on it since he used that one for the balloon flight in the early 90s.

Garmin’s transponders have solid state finals but still consume a fair amount of power. The GTX327 weighs 3.1 lb but you will need 4-5lb of battery to run it for a couple of hours

1897. Re: 35k foot floater? was RE: [Balloon_Sked] WB8ELK balloon still alive southeast of Halifax, Nova Scotia

Yahoo group: GPSL (2002 — 2008)
Date: 2005-12-20 03:37:41 UTC
From: Mike Manes
Topic: 1877 Message: 1897

Hi Robert,

Be careful about what you are promoting. Yes, what we pop up there is
a hazard to air navigation. I've seen what 6 lb goose did to the
windscreen of a bizjet at 250 kt, and the face of the pilot behind that
windscreen. His injuries were not imaginary.

Airlines have been sued for injuries to passengers incurred
during flight thru heavy clear air turbulence; a violent avoidance
maneuver at 550 kt can be much worse, especially if the seat belt sign
is turned off.

That 6 lb rule was written in the 60's when airliners were slower
and heavier, and most likely to accomodate the NWS radiosonds of that
era. Today's craft travel twice that speed in the jet airways, so that
same goose would have four times that impact energy against a
windscreen that's probably even lighter than those of yore. And there
are a WHOLE lot more airliners aloft today than back then.

We in the research ballooning community should strive our best to be
"good neighbors" in civil airspace, lest some dumb cluck exercising
what he believes are his "rights" gets some innocent schmuck hurt and
prompts the FAA to update FAR 101. Witness the latest UAV regs ...
There are no "hobby" or "educational" exemptions from neighborliness.

Re tropospheric floaters: NOAA recently flew some, but they were at
25K', well below enroute airways, and flew from the east coast across
most of the Atlantic. Gives you a clue, eh?

Woe be unto he who molluxes it for the rest of us!

Hi Mark,

Hmmm ... imagine the ends of the broken lines being connected by
a U-shaped curve that bottoms out on the surface. Then imagine
that some weight suspended at the bottom of the flight line gets
broken away while being dragged across the ground ... It's happened.

If there were no such "detachable" weight, then it's also possible that
the GPS was simply "lying thru its teeth" -- this has happened as well.

Hi Mike,

I've analyzed the winds aloft quite a bit the past couple of days and it sure looks like it stayed at 61,700 feet or at least within a few thousand feet of that level all night long until the Sun hit it and it started to ascend again. If it had gone much lower than that in altitude, it would've veered off course from the track and gone much farther out to sea since the winds were higher....the gap in the track lines connect pretty well indicating a fairly stable float altitude at night.

The interesting thing is that exactly a year ago, my balloon then did nearly the same flight path and also ended up off the coast of Nova Scotia.

The bottom payload was the APRS system so it definitely didn't get knocked off the flight train.

There was good GPS lock with over 9 satellites and an excellent HDOP as well so nothing appeared goofy with the Garmin.

I just happened to hit the free lift just right to achieve equilibrium at sunset.

Neither would I - right smack in the middle of commercial jet airways. Sounds like a solid FAR 101.7 bust! Unless one made sure all affected ARTCC's were kept aprised of current location and alt.

All it would take is a single airliner making an abrupt avoidance maneuver during food service to bring on the tort suits! I'd rather see this hobby last a while longer.

1901. Re: [GPSL] Radar transponder?

Yahoo group: GPSL (2002 — 2008)
Date: 2005-12-20 05:04:53 UTC
From: Mike Manes
Topic: 1883 Message: 1901

Hi John,

Our local FAA folks have expressed their desire for us to fly a transponder, But they haven't made it a requirement, perhaps because of our expressed concerns re weight, cost and EMC - especially QRM to our GPS receivers. Imagine the EMC immunity measures needed to protect against 200 PEP at 1 GHz with approx 500 Hz PRF!

They are pretty happy with the findu.com VOR reports, however. And in our last two annual blanket waivers for Colo Space Grant, they have made findu reports mandatory.

I recently surveyed modern commercial Mode C transponders, and found some that could be pressed into unmanned balloon service. E.g., the MicroAir T2000SFL weighs just 1.35 lb and draws 80 mA rx / 500 mA tx from 13.5 Vdc. It's pricey, tho, at $3K, plus annual recertification to ARINC standards. There are cheaper ones, in the $2K range, that are heavier and more power hungry. And used gear is even cheaper, but still bigger.

There is a new scheme similar to GPS-based APRS and findu that the FAA hopes to use to replace enroute radar and transponders. It's in "beta test" on the east coast, and I've been told that most more advanced nations like Europe and Australia have already fully adopted it. This implies:

1. Transponders will eventually go the way of dinosaurs.
2. It may be a trivial matter to tie findu reports into the FAA's new system.

So it may be best to sit on your transponder bucks for the time being, and take steps to get findu reports for every flight onto your local FAA control floors.

Re a "homebrew" transponder. Yes, it's no major technical challenge for a talented ham. The rub is getting an FAA / ARINC certification. That's the part that makes those silly little boxes cost so much. Note that they don't operate in ham bands, and even if they did, pulse modulation isn't an authorized mode until you get deep into the microwave ham bands.

From: Mike Manes
Topic: 1902 Message: 1902

Hi Mark,

I understand that some of the Colo Space Grant balloonsats have used glove warmers that carry their own oxidizers rather than relying on ambient PO2. Might be worth googling for "high altitude glove warmers".

Now, the issue becomes "how long will they last?", since this is gonna be a long-duration flight. Perhaps its better to conserve what heat's locally available, e.g., GPS receivers dissipate about 1/2 W continuously,
and the xcvr and linear voltage regulator may match that amount. If one runs the thermals, it seems reasonable to approach the problem thru additional package insulation. Now, it might be a good idea to provide means for distributing heat from the "hot spots" thruout the package, since normal convective heat transfer (hot air goes up) isn't very effective at 10 mbar. In fact, I've heard stories about some well-insulated balloon payloads actually burning up due to lack of convective cooling mechanisms that work fine on the surface.

I think Bill's approach thru adding insulation may prove to be effective.

If you use MapPoint with either APRSPoint or UI-View, you can update
MapPoint 2004 with the latest map data very inexpensively. All you need
is a copy of Streets 2006 or AutoRoute 2006. Go to
http://www.aprspoint.com/ for step by step instructions.

1904. WB8ELK Balloon delayed until Dec. 26th at 11:00 am CST

Yahoo group: GPSL (2002 — 2008)
Date: 2005-12-24 12:12:59 UTC
From: wb8elk@aol.com
Topic: 1904 Message: 1904

Although there is a very slim chance I'll fly something tomorrow, due to the high surface winds and 90 percent rain forecast, I'm going to postpone until Monday, Dec. 26th at 11:00 am CST from my farm in Falkville, AL.

Payloads:

144.39 - WB8ELK-12 (Callsign change)

Beacon(s): (one or more of the following:)

147.42 - WB8ELK audio message (FM)
146.565 - WB8ELK (audio CW)

28.322 - CW

Launchsite: Falkville, AL

73s de Bill WB8ELK

1905. WB8ELK flight today (Sat. Dec 24th) definitely a scrub

Yahoo group: GPSL (2002 — 2008)
Date: 2005-12-24 18:32:04 UTC
From: wb8elk@aol.com
Topic: 1905 Message: 1905

Lots of heavy rain about to hit, so no chance of a flight today.

Rescheduled for Monday, Dec. 26th at 11:00 am CST from Falkville, AL

http://www.arhab.org (http://www.arhab.org) for launch details as well as other flights across the world.

- Bill WB8ELK

1906. WB8ELK balloon launch status update

Yahoo group: GPSL (2002 — 2008)
Date: 2005-12-26 09:07:37 UTC
From: wb8elk@aol.com
Topic: 1906 Message: 1906

Surface winds are still high and gusting at 3:00 am....not sure if things
will die down enough to be able to inflate outside....I'll send out a status as
to whether I'll fly or not on Monday by noon....the latest I could lift off
is 2:30 pm CST....flight path will take the payload towards Atlanta.

Rain dates (all 10:00 am CST): Tuesday morning, Dec. 27th, Thurs morning
Dec. 29th or Friday morning Dec. 30th.

Payloads:

144.39 APRS - WB8ELK-12
Beacons: 147.42 FM (voice message), 146.565, 28.322 CW or 14.318 CW

73s de Bill WB8ELK

1907. WB8ELK balloon now scheduled for 9:00 am CST on Tuesday Dec 27th

Yahoo group: GPSL (2002 — 2008)
Date: 2005-12-26 18:15:39 UTC
From: wb8elk@aol.com
Topic: 1907 Message: 1907

Looks like good conditions early Tuesday morning....launch has been
recheduled for between 9 and 10 am Tuesday Dec. 27th....flight path will take it
between Calhoun and Dahlonega, GA.

I'll post another update around midnight Monday.

144.39 APRS - WB8ELK-12

Beacon: 147.42 FM (voice message)

- Bill WB8ELK

1908. WB8ELK balloon landing site prediction for Dec. 27th - noon launch

Yahoo group: GPSL (2002 — 2008)
Date: 2005-12-27 17:13:03 UTC
From: wb8elk@aol.com
Topic: 1908 Message: 1908

Very high winds with big gusts, so no go with the zero pressure plastic balloon, but will attempt it anyways with a 2000 gram balloon....launch in about 45 minutes at noon CST.

http://www.map.findu.com/wb8elk-12

Landing site prediction:

Armuchee, GA
34.2558
85.0704

73s de Bill WB8ELK

1909. WB8ELK Balloon in the air at 1828z from Falkville, Alabama

Yahoo group: GPSL (2002 — 2008)
Date: 2005-12-27 19:14:43 UTC
From: wb8elk@aol.com
Topic: 1909 Message: 1909

Wow...now that was a thrill...20 knot plus wind gusts with a 2000 gram balloon...bouncing off our heads during inflation and at launch missed the barbed wire fence by 1 inch...but it's up in the air and on it's way towards Armuchee, Georgia....going up around 800 to 900 ft/min.

Launched at 12:28 pm CST from Falkville, AL about 20 miles due south of Huntsville, AL

http://map.findu.com/wb8elk-12

APRS - 144.39 WB8ELK-12
Beacon - 147.42 FM (audio voice message every 8 seconds) - 50 milliwatts...should last 28 hours.

73s de Bill WB8ELK

Go, Bill, Go!
Sounds like a real tricky launch!
Only 80 miles downrange so far with a still-healthy
ascent rate... I think your 1400+ mile flight of a
week ago won't have any challenge from this one, but
you might get the sonde back.

-------- Original Message --------
Subject: [Ballooning] ANSR-28 Flight Announcement
Date: Wed, 28 Dec 2005 00:16:35 -0000
From: "kd7lmo" <mgray@...>
To: Ballooning@yahoogroups.com

Arizona Near Space Research (ANSR) in conjunction with ES-OS
(Experimental Sub-Orbital Society) is pleased to announce the flight
of ANSR-28. This high altitude balloon flight will take place on
Thursday, December 29th at 3:00 PM MST (2200 UTC). The launch site
will be announced closer to the flight date and will be based on winds
aloft.

The balloons will be two zero pressure balloons designed to ascend and
float for an extended period of time. Ballast will be released to
maintain altitude. A cut down mechanism will release one of the
balloon as it approaches populated areas on the east coast.

The flight will be attempt to set a number records as part of the 2005
Onset ARHAB (Amateur Radio High Altitude Ballooning Record)
competition. The portion we are attempting on this flight includes:

1. Longest Great Circle Distance
2. Longest Mission Duration
3. Greatest telemetry Distance (50 MHz and above)
4. Greatest telemetry distance (HF)

The following is the payload frequency plan:

APRS once a minute
50.62 MHz packet at 57 seconds UTC time via KD7LMO-11

14070.450 KHz PSK-31
At 0, 10, 20, 30, 40, and 50 minutes starting at 00 seconds UTC time

Additional details to follow.

Date: Fri, December 30, 2005 5:13 am
To: chat@...

Please share this PR with any group that may be interested.
Greg

The University of Tennessee Amateur Radio Club (UTARC) is planning to launch the UX-5 balloon on Saturday, Dec. 31. Approximate time for liftoff will be at 1830 UTC, or 1:30 PM Eastern Time.

UTARC will attempt the official distance record for this launch with a CW beacon on HF relaying telemetry and location information as the balloon takes to the air.

The balloon for the launch is designed for distance and longevity, so the flight may last over 24 hours if winds and equipment are favorable.

On UTARC's previous balloon flight, UX-4 was carried aloft by a 200 gram latex weather balloon, and was in the air for an estimated 2 hours, although the transmitter continued to operate for over 36 hours. Predictions indicate it probably landed in Virginia. The transmitter was built by Carl Lyster (WA4ADG) and had a 0.8 watt output. Reception reports were received from as far away as Minnesota, Utah, and British Columbia.

Recovery of the balloon is not anticipated at this time unless the balloon bursts early into the flight. Contact information will be on the balloon in case of a physical recovery.

The telemetry feedback will be in the following format:

Frequency: 14.325 MHz ? 2kHz
Mode: CW
Sequence: AA4UT/B every 15 seconds; full telemetry every 4 minutes as follows:
HI HI AA4UT/B
ALT xxxxxM
LAT xx.xxxxxx(N|S)
LON xxx.xxxxxx(W|E)

SATS xx
TEMP (P|N)xxxC
BATT xx.x VOLTS
SEQ xxxxx
PSE QSL WWW.UTARC.ORG <http://WWW.UTARC.ORG>

Weather forecasts for the launch are not looking pleasant, but UTARC is still planning to launch even if conditions are less than favorable. Weather does not normally affect a balloon launch unless adverse conditions affect the safety of the crew.

As of now, the forecast is as follows:

Saturday: A 30 percent chance of showers, mainly before 8am. Partly cloudy, with a high around 54. West wind between 5 and 10 mph.
Saturday Night: Partly cloudy, with a low around 32.

As with the the last launch, postings on DX Clusters will be made and signal reports can be sent via the web site at http://balloon.utarc.org

This is a long-distance record attempt. Your reception reports will be most welcome and valuable.

Greg Williams, K4HSM

The UX-5 balloon lifted off from Knoxville, TN at 2:31 pm EST (1931z) and is ascending around 200 ft/min or so....please listen to 14.325.5 for the CW message....The callsign repeats every 15 seconds and the telemetry sequence is sent out a minute after a 8 callsign intervals...but could take as long as 10 minutes if the GPS isn't locking.

Signal reports are already coming in from OH, NY, NJ, OK, WI, CO and MA.

This is a long duration flight that should go out over the Atlantic and could fly all night like the one I did 2 weeks ago.

Please post signal reports to: _http://www.utarc.org_ (http://www.utarc.org)

Mike,

Heard first telemetry at ~2017z but QRM clobbered everything but altitude = 2859.9m

Tried again at ~2024z but QRM made copy impossible.

Tried again at ~2038z. Frequency was quiet. Heard QRX and started recording. Nothing heard after that until 2048z:

ALT 5185.0M
LAT 35N50.4689
LON 082W46.3186
SAT 09
TEMP P014C
BATT 12.3V
SEQ 006

Well done!

I'm very faintly hearing it in KS. My poor skills can't copy that far
into the noise, but there's definitely something there.

I have about S-6 noise at the moment, and the CW isn't touching the needle.

1922. UX-5 balloon now at 10882 meters just east of I-95 near Rahleigh NC as of 2318z

Yahoo group: GPSL (2002 — 2008)
Date: 2006-01-01 00:14:29 UTC
From: wb8elk@aol.com
Topic: 1922 Message: 1922

Hi Harry...you've got the perfect place in the country to copy both AZ and TN balloons!!!....as of 2318z, the UX-5 balloon was crossing I-95 east of Rahleigh, NC at about 35,700 feet...(10,882.6 meters). I appears to be descending at about 150 ft/min so it will take 4 more hours to come back down...by that time it will be well out to sea....they've designed the payload to float in the water and then go back up at sunrise, so keep listening for it in the morning and during the day tomorrow.

73s de Bill WB8ELK

http://www.utarc.org (http://www.utarc.org) has a form for reception reports on it.

http://forums.utarc.org (http://forums.utarc.org) go to Balloon Chat....then Balloon Report...for live updates as they come in.

1923. UX-5 balloon now probably over the Atlantic off the coast of Cape Hatteras NC

Yahoo group: GPSL (2002 — 2008)
Date: 2006-01-01 01:41:09 UTC
From: wb8elk@aol.com
Topic: 1923 Message: 1923

The GPS stopped giving good reports after 2318z....at the time it was near I-95 east of Rahleigh, NC heading east at 35,700 feet.

The last reception I had on it was via a remote receiver (_www.dxtuners.com_ (http://www.dxtuners.com)) from Tidewater, VA which is near Virginia Beach and about 80 miles from the balloon at the time....tough copy since they are using a PCR-100 with no CW or USB mode (with a discone no less)...I copied the telemetry by listening to the noise change via AM mode...reminded me of Aurora buzz mode CW.

Last copiable report was 00:44z...nothing since then....Battery was 10.4V and temp was -39C but the lat/lon hasn't changed since 2318z.

I estimate that if they hold altitude around 35,700 feet all night, they'll go out to sea and veer northeast towards Nova Scotia and Newfoundland...It is more likely that it is coming down slowly which would have it splashing down soon about 100 miles east of the NC coastline....they have designed it to be waterproof and to float with the antenna sticking up (nice seawater groundplane)....so please listen in on 14.325.5 tomorrow morning and during the day since it will probably take off again at sunrise even if it's floating on the Gulf Stream instead of the Jet Stream.

It was recover yeasterday (December 31st) around 5 PM local New Mexico time. Here is a note from Jack, W7JLC:

We were still getting reports back from it during the morning as soon as the band opened up again.

So it will live to fly again!

Pat, N5BBD was able to get away and has just recovered the ANSR Payload. It came down through a Mesquite tree, the balloons were shreaded. The package was upright with the antenna still vertical up into the tree. There was only a small amount of the ballast liquid left. More later.

1927. NOAA Smart Balloon

Yahoo group: GPSL (2002 — 2008)
Date: 2006-01-02 16:24:23 UTC
From: Ralph Wallio, W0RPK
Topic: 1927 Message: 1927

http://www.noaa.inel.gov/Capabilities/smartballoon/

With funding from the U.S. Weather Research Program (USWRP), NOAA Air Resources Laboratory, Field Research Division, in collaboration with the University of Hawaii have made improvements to the smart balloon (constant volume adjustable density balloon) that will make this platform suitable for hurricane research. The 10.3-foot diameter balloon shell has been redesigned to allow the transponder and sensors to reside inside the balloon shell to help protect them from turbulence and rain that may be encountered inside a hurricane. The temperature and relative humidity sensors are no longer passively aspirated but are housed in a radiation shield and are fan aspirated to increase accuracy. A rain gage has been added to provide information on the precipitation rate as the smart balloon moves through rain bands within a hurricane. An infrared temperature sensor has also been added to provide remote sea-surface temperature data. Satellite communications replaces the point to point radio system to allow continuous monitoring of the balloon position and sensor data without requiring an aircraft to be in close proximity to the smart balloon.

The improved smart balloons will be deployed as a part of a Lagrangian experimental strategy to better characterize the evolution of the energy content of the marine boundary-layer inflow to a hurricane and its relationship with hurricane intensity changes. This effort will be accomplished in cooperation with reconnaissance missions flown by the NOAA Hurricane Research Division.

This is an interesting concept of using compressed air as ballast. It requires a firm shell for pressurization. Their initial concept used ordinary weather balloons that were treated with some sort of polymer. More on this at
http://www.soest.hawaii.edu/MET/Faculty/businger/information/PDF/DOC02.pdf

Depending on cost and weight, this could provide a low-cost means to create ARHAB floaters. The polymer may not be necessary for our purposes. The fun part may be getting the smaller balloon inside the larger one, though it may be possible to place the balloons side by side within the outer shell.

If the outer shell could be made relatively air-leak-free, then perhaps only one balloon would be needed, or perhaps a polyurethane bladder could be used as the outer balloon if it's not too expensive.

Hi,

This is the scheme used in the NOAA GAINS project that EOSS has test-flown a few times. The hard part is compressing the air with a pump that doesn't require more battery weight than the balloon can lift. The rigid shell was made from sewn-up ripstop nylon enclosing a latex balloon, and there was a second latex balloon inside for the compressed air. Spectran can be used in lieu of nylon for UV-resistance for LOOOOONG duration flights of many days.

Compressed air ballast has been used before, I believe, like on one of the manned circumnavigation flights. Dense ballast, like sand or fluid, is considered "fuel" by manned helium balloonists. When you run out of ballast, yer coming down (eventually)!

Russ Chadwick KB0TVJ manages that project for NOAA, and he's also a valuable EOSS member. Russ is responsible for the FAA reporting scheme on findu.com.

1930. Announcing BeeLine GPS

Yahoo group: GPSL (2002 — 2008)
Date: 2006-01-04 21:12:50 UTC
From: k7rkt
Topic: 1930 Message: 1930

Hi everyone,

THe following announcement was made to some of the high power rocket groups, thought I'd forward it to this group to see if there's any interest. I know that it's pretty simple to put together a small HT, tinytrack and GPS to make an APRS tracker, but if size or weight is important, take a look..... I'm also willing to listen to requests for customizing firmware. For example, adding a temperature sensor.

Original message follows......

BigRedBee is please to announce the availability of the BeeLine GPS Transmitter!

Priced at less than $260, weighing less than 2 ounces and fitting inside a 38mm body tube, tracking your rocket has never been easier or more affordable!

http://www.bigredbee.com/beelinegps.htm

The BeeLine GPS consists of a 70cm FM transmitter and a GPS receiver. Data from the GPS receiver is encoded into standard APRS data packets and then sent out via the embedded 440 Mhz FM transmitter. A standard ham radio receiver along with a PC soundcard and/or amateur radio gear (standard TNC hardware) can be used to decode the data packets. No need for dedicated receiver hardware!

A complete package consists of the BeeLine GPS transmitter, an RS-232 serial adapter, 750mah lithium poly battery (that lasts for more than 8 hours), a li-po battery charger, and SMA antenna connector. The serial adapter and battery charger are compatible with the existing BeeLine transmitter.

A valid amateur radio license is required.

Regards,

-- Greg BigRedBee, LLC

From: nssdz
Topic: 1927 Message: 1933

This isn't new really, We (Near Space Sciences)played with it maybe close to ten years ago. With limited success. Or possibly a total success, we honestly do not know.

I placed into the Photos area on the group page a new folder called NSS. Inside it has 5 pictures you can look at to see what I'm describing.

I'm still trying to find the pictures of the launch, but after moving three times since that flight, i can not seem to find them at the moment. When I do I'll put them also in that folder.

Picture #1
This is a picture of "EarthWinds" a manned version of the similar idea.

Picture #2
A more closeup detailed image of a similar configuration.

Picture #3
This is our project we called it "EarthBreeze" we were doing this at the same time as the "EarthWinds" project, so adopted a similar name.

The Anchor balloon, was made of a slightly heavier wall latex balloon, it was made for the advertising industry, and had a thicker wall so it could take a wee bit more abuse. It similar in size to a TA-300,, but weighed in at the weight of a TA-600.

Anyway the restriction envelope was made from a custom rip stop nylon, It weighed like 10% of similar thicknesses and thread counts, and yet was like twice as strong. It was donated to the project by the manufacturer,, Who? I don't remember, all I remember is when they said how much it cost I almost died!

The diameter of the restriction envelope was determined by three things,

Required amount of anchor.

Available "Bladder" balloons

And most important the final surface tension on the restrictor envelope. I had a program from the fabric maker that would calculate the surface tension for a given diameter vs presure,, and it was incrredible!!

We went "Passive" No pumps, or valves etc. We crunched tons of numbers, we knew what the max altitude would be for the system, so we knew we needed to stay below that height,, so we targeted, 90% of the POP height as our ceiling. ~80K

And then we figured the needed lift that the system would need to stay aloft after sundown. And stay above 60K

Then we figured in the sun-up gain, and calculated the amount of anchor required to stay below the~80K level.

Pushing all those numbers around finally came up with a certain restrictor diameter, that would work with minimal size yet enough anchoring capability. so it would have zero lift at say 65K and yet enough anchor to stay below ~80K

We also knew what the amout of cubic feet of air we needed at ground level we needed to put into the anchor balloon. And then simply tied it off. And that is what you see in Picture #3 The partially inflated Bladder balloon (blue) in the restrictor bag.

Picture #4
Is the Payload itself, it was just a small aluminum project box, maybe 3" cube? It had attached on the ende styrofoam "Floats" Just in Case it went for a swim. The ends of a 20 meter dipole came out the top and bottom.

Picture #5
This is the inside of the payload. definately a throw away! This was before GPS's and all that, all it was, was a pair of the "D" size surplus lithium cells, one of those clock osccilators, and a modified radiosonde baroswitch.

We removed the switchplate, and replaced it with the sliding portion of a slide potentiometer.

The variable resistor controlled the message interval.

A LONG CW message was made with that chip.. It was great! Not totally sure anymnore who made it,, But I got it from Mark KA9SZX.

Anyway, at ground level it ran like 1 WPM. so slow it was annoying it took like 5 min to send the whole message!.

But at altitude, it would have sent the whole message in about 10 seconds or so.

So, how did it work? Hard to say, wish GPS's were available back then,,, well cheap ones at least. because all we had to go on was the timing of the message, (shows altitude) and peoples Beam headings (shows location)

Well, it lifted off at about 2 hours after sun-up without trouble,, was surely a strange sight tho. All was working great. it climbed at an normal rate through our estimated by the timing interval through 30K the ballon then seemed to slow some. but kept climbing. Finally, after more than 4 hours of flight, the message interval stopped changing and stayed constant. By the interval we determined that it was slightly past the desired ~80K and was more close to ~90K! but it

was staying up there,

We and a net on HF followed it all day, and we thought YEAH!, then the moment of truth,, sundown!

The interval message almost immediately started slowing down as expected, we just didn't expect that soon.

Now we though it's now to see how far it sinks till it levels off again.

It was quite slow, took over 2 hours to drop to ~70K (estimate) Then it happened,

I'm thinking the cold finally made it into the resistor card, what happens to resistance under extreme cold,,? you guessed it!

The WPM speed started climbing, we thought something happened to the anchor balloon,, like a seam popped or something because we thought it was climbing again.

But it started going crazy warp speed! The whole message sounded more like packet then CW.

Someone with their computer with a soundcard was listening to it,, and the whole message was going out in like 1/2 a second!

A houir later it started getting a hissy broadband sound to it. then it started getting intermittent, and a hour later dead scilence!

We listened for a few hours more, Nothing.

At sunup we started listening again.. Thought maybe we could hear it,, maybe not,,? started asking for reports on freq, and several station came on saying they hear it in Florida, colorado, and up in VE3 land,,

I told them to time the interval, and get their best beamheading they can.

By the interval, it seemed to be at ~75K or so. YEAH!!!! And by the beam headings somewhere in 1 land.

DAMM I CAN'T HEAR IT!

Kept tabbs on it all day,, and into the next night, when the same thing happened,, hyperspeed,, then death.
Last guess beamheading was from Maine, England and again Florida, and they crossed someplace slightly east of Iceland.

So did it work? sems so, but without better gear and GPS onboard, will never know for sure,, Will we try it again?

Love to!

Take Care

That, plus operation in ambient temperatures down to -80C and
GPS funtionality to over 120,000 ft MSL (preferably to at least
40 km elevation in $GPGGA word.

Some very interesting history of air ballasted
balloons - the Earthwinds project - is included in
"Just Winds", Bill Armstrong Jr.'s book primarily
about the Earthwinds Project.

It seems like a lot of technology for a low level,
couple day flight - sand or liquid ballast can do the
same job with much less hassle it seems.

Mike,

I almost made a short list that would have included low
temp. operation, but just stuck with the power output.

Greg, I think Mike's questions are certainly worth
including in specs for ballooners, and to that I'd add
the lower voltage limit for proper operation.

Have you been able to test the stability of the PLL to
any kind of cold temperature, say at least -10 F? I use
that because it might not be too hard to attain in a
consumer freezer, not that it's adequate for balloon
use.

It looks like a nice product, but my impression is that
it's very expensive from a ham (at least this one)
perspective.

Good points, all of them. I'll see what kind of specs I can dig up
on temperature, as well as do some actual testing in the deep-freeze.

From the feedback I've gotten, the biggest drawback is the lack of
support on 2 meters-- perhaps something I can address in a new
version of the product.

As for the price.... The pricepoint was picked to be be *way* below
some of the other small, integrated devices out there intended for
the high power rocket market (where size is critical), like
GPSFlight. But I agree, compared to an old HT and a surplus GPS,
this product is more expensive unless size/weight is a factor.

Regareds,

Engineering students here were able to get a commercial freezer
down to -38F by bypassing the thermostat. Adding insulation
would probably help too. Avoid self-defrosting models :).

It's pretty simple to maintain a min internal temp of -10C if
there's a few watts of power dissipation inside and the package
includes even modest thermal insulation. But I wasn't sure if
the BeeLine came packaged - at 2 oz, I reckon not.

I agree, if the flight's just a day or so. But for longer
flights, ballast is like fuel - when you run out, the end is
near. But air is always there for the pumping, if you have
the power to do it.

Hi Greg,

I think your price point is quite reasonable. I understand that making quality products designed for hams is a challenge as the market is fairly small and the investment in time and capital is signifigant. I appreciate the work you have put into this design and making us aware of it. I would suggest that you consider using dry ice for your temperature testing. It will get you to realistic balloon temperatures (-92 degrees) with little cost and without causing probable damage to your freezer by modification.

Forwarded email, on HABITAT SkyLab balloon launch
Sunday 1/8/6:

I got my BigRedBee "Beeline" GPS back today with the
latest firmware and it
is ready for it's maiden balloon flight.

Don & Group this what I have setup for Sunday's 10am
launch at the park.

TT3 Package = 144.34 K0NMS-11 and is set for time
slotting on the 13
second.
Beeline GPS = 441.175 K0NMS-7 and is set to beacon
once every 15
seconds.
Beeline Beacon = 433.72 CW of K0NMS and it also
does CW of bat voltage.
Rino = Chan 13

I have my new chute with the cut down device installed
and ready for it's
1st
flight.

As you can see from the above call signs -- I seem to
have the Vegas
gamble
in me with using "7 / 11".

Later - Nick
K?NMS
WPWG368

We (Nick) will be flying one tomorrow.

From Nick email to our group:

"I got my BigRedBee "Beeline" GPS back today with the
latest firmware and it
is ready for it's maiden balloon flight.

Don & Group this what I have setup for Sunday's 10am
launch at the park.

...

Beeline GPS = 441.175 K0NMS-7 and is set to beacon
once every 15
seconds.
Beeline Beacon = 433.72 CW of K0NMS and it also
does CW of bat voltage.
Rino = Chan 13 "

Today, I hope to get the RINO (FRS) Text-To-Speech
add-on packed up for flight tomorrow. I haven't
decided on the FRS channel yet. First flight will be
pretty simple, periodic altitude voice announcements
and ID. IF I don't break it. ;-) Either way Dean and
my RINO/OpenTrak package should fly tomorrow with my
callsign.

1944. Habitat SkyLab reception reports from Iowa

Yahoo group: GPSL (2002 — 2008)
Date: 2006-01-08 19:24:25 UTC
From: Ralph Wallio, W0RPK
Topic: 1944 Message: 1944

Don,

All of this was over a line-of-sight path distance of ~180mi (181.78mi when at 35kft).

144.34 APRS data was copied from 15k on up via an omni-directional vertical.

BeeLine CW beacon came up out of the noise via a vertically polarized 10ele Yagi e/w a mast-mount low-noise preamp from ~25kft on up. It was armchair copy ~35kft on up:

~25kft N0NMS V1 4.24 V0 4.11
~35kft N0NMS V1 4.24 V0 4.11
~45kft N0NMS V1 4.23 V0 4.10

(Note the difference in transmitted characters ~45kft vs both ~25kft and ~35kft. At first I thought these were software version numbers but, with the difference in characters, maybe not.)

I was listening via two receivers and antennas but never heard a peep of BeeLine APRS data on 441.175.

RINO locating data on chan-13 was full quieting on an FRS HT from ~35kft on up. If I were RINO equipped I probably would have received position reports. This is an interesting experiment which I would like to read about in someone's web pages.

Thanks for the report Ralph. I just got the truck
unloaded and walked in the door to check email.

Got some other reports. All in all another successful
flight, after a VERY WINDY launch!! Thankfully, a very
easy recovery, in a corn field.

If Nick/Jerome don't write something up on it, I will.
I got some good photos, I hope, of both CW and GPS at
lunch. It was a very interesting topic at lunch. I
think several of us are sold on them.

More later,
73 to all,
Don

As you could tell I didn't fly the Text-To-Speech board on the RINO as I had hoped. It will be more of a priority for me on the next flight. It should allow anyone with an FRS to get voice flight updates, primarily location, altitude, temperature, course and direction from the balloon. Should allow and kid with a cheap FRS particpate. Did I understand; you heard it ok, at least the position report data.

My experiments, should show up, at some point but it's been years in the making so far. ;-) As is true with my other projects, I am being tought to just keep my mouth shut. Good training in that regard today. ;-)

I'll need a name and address for the awards.

Who is my POC for HABET?
WB8ELK, what addresses do you want me to use? You get two subscriptions, so please pick two team members.
Harry
Michael, are you my POC for ANSR?
Don

Thanks everyone.

Paul

I'm still waiting to hear from OnSet and Kaymont.

1956. APRSLink - email to anywhere from APRS messages

Yahoo group: GPSL (2002 — 2008)
Date: 2006-01-21 11:13:33 UTC
From: Ralph Wallio, W0RPK
Topic: 1956 Message: 1956

E-mail messages could be sent and received by balloon payloads to/from any e-mail address -- could be used to send telemetry reports to and receive commands from a distant command ground station. APRSLink is up and running today. -w0rpk

* Winlink 2000, APRS join forces with APRSLink:

Following the Amateur Radio response to some recent disasters, Bob Bruninga, WB4APR, proposed using the Automatic Position Reporting System (APRS) to enable mobile and remote APRS users to access their Winlink 2000 e-mail accounts under emergency or unusual conditions.

In response, the Winlink 2000 development team came up with APRSLink. APRSLink monitors all APRS traffic gated to the Internet and watches for special commands that allow APRS users to read or send short e-mail messages to and from other Winlink 2000 users, perform e-mail maintenance, receive notices of pending Winlink 2000 e-mail via APRS and query the APRSLink server for information on the closest Telpac gateway or Winlink participating station.

Details are on the APRSLink Web page <http://www.winlink.org/aprslink.htm>.

I ran across this in the morning paper here in Fargo, ND, and I wanted to ask the experts here for their opinion:

http://www.in-forum.com/articles/index.cfm?id=115295§ion=News

I'm not sure directly hotlinking to the article works, but if not, it's about a company here in ND that plans to loft balloons with cell phone repeaters to 20 miles up, to provide coverage for the more remote parts of the state. They will have nine balloons in the air at any given time. It's much cheaper than putting up towers every 30 miles.

I know this isn't a new idea, but I wonder if this will actually work. Based on what I know about how ballooning works, these things will only be at their max altitude (and cell range) for only very short times. Unless they have a way have them hang at a specific altitude, but nothing in the article mentions that, and their per-flight cost seems too low for these to be very sophisticated.

Finally, does this mean ballooning here in the northern plains just got easier, or more complicated with the extra traffic?

Paul,

The Space Data payload enclosure includes both an internal hydrogen/helium valve to dump lift as necessary to start floating -and- a ballast dumping system to offset loss of lift as necessary. Both capabilities are autonomous. The balloon attaches directly to a short pipe (part of the valve) the protrudes out the top of the enclosure. Gauge by eye, the enclosure is ~1/2cuft. I quickly searched their web pages and Goggled for a picture worth a thousand words but have not found one.

They do not chase for recovery but depend on the public to find and then return the payloads for a reward (NWS gets back ~75% of their radiosondes without a reward).

Space Data payloads weigh <=4lbs so their flights are Part-101 exempt. This is a guess but I doubt that they have any more contact with the FAA then does the NWS for twice daily radiosonde flights from 70+ CONUS locations. This is also a guess but a big operation as described for North Dakota cellular service could be to our long term advantage.

Ralph,

What image were you looking at to make that estimate? Is
it one of the older magazine articles from a few years ago?

Interesting about the oil industry tracking that has already
been done by Space Data. Had anyone read about that in
general newpapers, magazines, or industry trade publications
(oil or electronics).

1962. RE: Balloon-based cell "towers" --very long reply

Yahoo group: GPSL (2002 — 2008)
Date: 2006-01-23 23:59:50 UTC
From: Steve KA5YFC
Topic: 1958 Message: 1962

First, I would think that if this were a viable alternative to putting up cell towers that there would be thousands of these flying every day. Cell companies are all for maximizing their profits.

Second, I don't know about any of you but launching a hydrogen filled balloon in 20+ mph winds is very scary. Hey it's bad enough with helium.

Third, look at the expense of this program. North Dakota has some of the harshest winter weather in the US. The winds can be and are very strong at times and contrary to what the article says, the winds may be predominant in direction at some times of the year but they do change. The man-power that you would have to have on stand-by in case you couldn't launch from your primary site plus the fact that you have to have people at the launch sites 24/7 (figuring four per site with three primary and three alternate sites but that may be a smaller or larger number) and you could easily have 24+ people working with half of them not working on the mission. They may even need more than six sites but they would have to figure out the logistics of where to launch from on each flight.

Fourth, to have this kind of coverage they would have to launch a balloon every hour. A typical flight that we try to do for altitude last between two and three hours. To have one at altitude and one descending and one ascending means one every hour. You need to have at least a two day supply of balloons and cell transceivers for each site so that would be 48 per site. You would have to have this at each of your launch sites. If there are only six sites, three in the northern part of the state and three in the southern portion, then you would need 288 on hand. This is assuming that you can get delivery of new balloons, hydrogen and cell transceivers every two days at the least. I also would not count on getting back 75% of the packages. The territory there is not well populated (this is the reason for the balloon approach in the first place) so there may or may not be someone near by to see or recover the package. Oh, and you need a few extra balloons for that occasional burst during fill or other incident. At GPSL last year, one of the packages cut away early, very early. You would need an extra balloon, transceiver and hydrogen to replace that immediately. You would have to get another one up there to replace it, NOW. Oh, and they have to launch in any kind of weather as they _have_ to provide the service.

In the article they say that they will be flying above the jet stream but that also means that they have to go through the jet stream twice during the flight. If they cut away the package when the balloon leaves the North Dakota airspace (as they say in the article) then they may need more packages as the jet stream crosses the state very frequently.

I haven't really looked at the coverage of each of these flights but as we know from Wbaltrak and experience, the transponders will cover a huge area and of course the radio signals do not stop at the international or state boarders. I have no idea how the Canadians would look at this. Or even how those in Montana, South Dakota, Iowa, Minnesota, Nebraska and Wyoming would react. And that is from one balloon launched from the center of the state to an altitude of 91k ft. (that is the current data available from Glasgow, MT as Bismarck, ND only went to 25k ft. and is the only station in North Dakota that launched a weather balloon for NWS). Peak winds were 130 mph at approximately 33k ft. Is this all autonomous operation or will they manually cut away the package? Have to hope the OBC doesn't ever fail. Interference from those other states could make it very hard to use the transcievers on the balloons. Just too many signals trying to use the limited resources. That's part of the reason that cell sites ar moving lower in heigth and more of them. Can't forget the "cone of silence" under the balloon and I'm not sure they really know how violent it is up there. We have seen the video and it's not a pretty sight.

The other thing that I have been wondering about is how they are going to provide both a T-1, or greater, uplink and downlink to the balloon. That will take one fat pipe to do that. 802.11a is only 54MB per second and a T-1 one is a lot faster than that. If this is to provide both voice and data to the remote areas of the state they will have to find a very large pipe (read bandwidth and frequencies) to get the job done.

The legal ramifications to this is tremendous. If for some reason a balloon didn't launch and someone needed to make an emergency call and couldn't get through because of it, who is going to be responsible? The carrier, the balloon company, the transceiver manufacturer if the failure occurred in mid air (we have all had that happen at one time or another). If the problem did occur in mid air, would they cut away immediately and how long would it take to get another balloon into the air and to altitude? Help us all if one of their packages comes streaming in without a parachute deploying (been there, done that, no fun).

One good thing that would come out of this would be nearly immediate wind data for the state and on a continuous basis. Of course, there would be lots of opportunities for improving Dfing techniques and testing new antennas and verifying tracking software and lots of things like that. Of course, you get local coverage up to 400 miles away from home.

I just think that there are some inherent problems with providing phone service over a balloon path. There are probably lots more to look at that I haven't even thought about. Of course, I liked the comment in the article. "I know it sounds crazy," Schafer said, "but it works in the lab."

>>>> Paul: who knows- it could work- but I predict this will be a terrible financial bloodbath for anyone who invests, following the same pattern of Motorola led Iridium ($7B invested, sold at bankruptcy auction for $25M (as reported at http://www.sbe24.org/archive/c24jan01.asp#ten , GlobalStar ($5+ Billion dollar write-down at bankruptcy), and even my favorite, Orbcomm, with a wee $250M invested, but even the remote messaging services didn't pay back the nut to launch and maintain the constellation. The terrible economics of all these systems should have been transparent from the outset, but were brushed under the carpet with the gleeful sales pitch to investors about how great it will be to 'be connected' whether one is at the north pole, in the middle of the Gobi Desert or elsewhere. But not in a house or office building. The question that many people never seemed to ask was: how big of a market is this.... at the (1992 predicted and 2002 actual) price of $4/minute for talk time?

Funny thing is, I view the economics of satellite based comm systems to be as-now preferable to balloon based comm systems.
I've done a good amount of professional work in both fields.

Orbcomm was reported to have about 250 full salary professionals on the payroll before the financial deck of cards caved in before their first bankruptcy.

Obviously, a balloon constellation over North Dakota is a far cry from any LEO system, but here are some numbers to consider:

North Dakota population: 650,000
70000 square miles
% of persons living in cities, presumably already well served by normal cell phone service: _____
(unknown.... a very important figure though for this discussion)
median household income: $34.6k/year (1999 US Census numbers)
per capita median income: $17.8 k/year

My admittedly rough numbers for the proposed system:
total subscribers:
32500 (5% of total population- remember most of the city dwellers are presumably serviced by a normal cell phone company)
250 minutes per month per subscriber (a far cry from the 1000 minutes a month I get in Denver for $50+ taxes, but it's a rough planning number..... back in 1994 I recall 30 minutes per month cost $30/month. Times change. Sound quality was a lot better back then, though....)
8.1 million system air time minutes per month
270k system minutes per day
9 birds per day
30000 system minutes per balloon... average.

Ok, stop for a second. This is a WHOLE lot more capacity than something like a nice airborne repeater. So don't think this system is going to be remotely similar to the cross band repeaters flown with great success by amateur groups. Just because the EOSS cross band repeater is 3.3 lbs (or whatever) don't think that the proposed stratospheric digital brick will have many similarities. So this is in simple terms like an ARHAB cross band repeater with capacity for 501 hours. Ok clearly they're not going to use wide-band FM, but even with all the digital compression you could shake at it, the 'brick' will be a pretty impressive (or heavy, or expensive.. or all of the above) piece of hardware. It's entirely plausible that the system ground station(s) will have tracking antennas..... but making the link from the bird to the user's handset - using a handset remotely 'in family' with current cellular offerings will be challenging. A 1/4 wave whip on a car rooftop of course helps the situation to the tune of ~30dB..... will subscribers be motivated enough to make a hardware installation choice like that or will the

'birds' be stuck trying to make a link to low power compromise handsets with crappy antennas? Probably the latter. And the situation deteriorates when you reason through that a handheld unit in a car is most likely completely shielded by the car's roof.... allowing a nice line of sight only to the bird on the other side of the state - 20 miles up and 200 miles away. The birds right over head are not accessible to a low power, hand held unit used inside a car, which is a huge amount of the usage profile of a cell phone like system. The cell phone offeror of 1991-1993 could charge $1000 for a 1+ lb handset back in the day... the current day offeror of 'balloon sat' phones will have the 'curse' of small, light, long life phones that exist on any 'normal' cellular or wireless telephone system today as a point of comparison for any balloon sat phone hardware they may bring to market.

Ok further rough projections:

$55/balloon
$50/batteries per flight (remember, MUCH more power than ARHAB birds)
$100 launch and gas (if you reduced it to one phenomenally responsible minimum wage worker with no benefits)
$200 bounty for recovery per payload hmmm maybe that's high as they'll be raining out of the sky at the rate of 9 per day. who knows what the market price for this is..... if the bounty is too low they'll sit and rot, too high and people will be getting assaulted at the LZs..... but anyway....
9 birds per day.. actual re-use rate to be determined.

$1.3 M/year to run the airborne side....
$5 M/year to run the ground station
ok.... marketing? at least a couple million a year....

add it up and you're at $250/year per subscriber just to keep the lights on..... and that's neglecting the amortized development costs of the airborne hardware, the ground station hardware and infrastructure and the subscriber hardware. Although this is seemingly do-able in my mind, but I suspect there is much more to this than I've delineated above which will make this very significantly less attractive. The first thing that comes to mind is huge amount of trespassing cases that will clog the courts when 3 or more 'bounty hunters' decide to do a renegade recovery on the same

piece of hardware while the landowner thinks that he owns it. This WILL get to be a big issue in a short period of time. A fly back sonde will cure most of that, but adds to development cost appreciably..... So of the techno-people on this list will estimate my rough number projections as way too high, I suspect people with real telecom/wireless experience may find my projections laughably low..... but it's a cold winter night here and I couldn't help but throw some numbers against this concept.

73's to all.

Hi Steve. Thanks for your thoughts. As a member of a group that's done ballooning in ND for years, I heartily concur that there are not many days of ideal weather to be had, and the winters are a pain.

> The other thing that I have been wondering about is how they are going
> to provide both a T-1, or greater, uplink and downlink to the balloon.
> That will take one fat pipe to do that. 802.11a is only 54MB per second

Have to correct you there: a commercial T-1 is only 1.54 megabits per second, so any 802.11 link running full-bore is faster. Keeping a full-bandwidth digital signal to the payload at all times is, of course, wishful thinking :).

You're absolutly right on the quality of service issues, and trying to trace 911 calls from non-GPS enabled phones would be a nightmare.

Anyway, others in our group are trying to find out more info on this. If anyone does, I'll be sure to share it with everyone.

Hi K-Mark,

Your analysis seems to assume use of short-duration flights.

The schemes I've read about rely on long-duration (months)
station-keeping stratospheric blimps using air ballast.

How would that affect your numbers?

Hank,

The image that is burned into my memory is of a small payload enclosure being held up by an engineer which included the attached neck and lower portion of a latex sounding balloon (as if ready for launch). As I recall the photo was prominently displayed in Space Data's web pages of a couple of years ago.

Space Data Corporation LLC also uses the corporate names, Space Data Research LLC and Space Data Spectrum Holdings LLC. They are FCC licensed as a common carrier to provide mobile services and hold 255 FCC licenses the vast majority of which are for 900MHz PCS narrow band and a few for 931MHz paging. These 10yr licenses expire 2013-2015.

Hi Paul,

Yeah, it's theoretically do-able, and in fact, DoD & HSA are looking
at similar stuff for high-altitude radar and comm platforms.

The scheme is to stay above 60,000 ft, where the radio horizon is about
350 miles out, and which is above FAA jurisdiction, so the only FAA
issues are in the ascent and final descent phases.

The problems are long duration station keeping.

Long duration means not venting any lift gas, so the balloon envelopes
are impermeable and not subject to UV degradation (i.e. plastic vice
latex). Since the lift gas density and thus lifting capacity varies
with solar heating, maintaining altitude requires unloading ballast
at night. But if the supply of ballast is limited, then so is the
flight duration. The solution is to use air as ballast: just suck in
what's all around you and compress it into a 2nd rigid balloon; that
will make it denser than ambient air and thus will increase the system
mass. As night falls, just vent the air bag.

Geoidal station keeping requires continuously flying upwind.
Fortunately, stratospheric winds are generally less than 20 kt, so
it's not a huge power hog. A couple of electric motor driven props
can manage it, especially if the envelope is streamlined along the
horizontal axis ... think blimp.

Now, all that air-compressing and prop turning requires a contiuous
source of electrical power -- not to mention the power required by
the payload itself. Solar panels covering the top of the envelope, along
with rechareable batteries like Li-ion, are what current schemes
envision. There are no cloudy days in the stratosphere.

Any ARHAB groups out there wanna give it a shot, eh??

yeap. that is what the article mentioned.

> The schemes I've read about rely on long-duration
> (months)
> station-keeping stratospheric blimps using air
> ballast.
>
> How would that affect your numbers?

(from Mark Caviezel):
>>>>>>>>>>>> I know a good amount about this, having served as principle investigator of a 6 month MDA/Army funded study for exactly this technology a couple years back. The small group that I worked with initially proposed a disposable balloon constellation- not dissimilar to what is envisioned for the North Dakota network- was awarded the contract, then was immediately re-tasked to study high altitude blimp type platforms. I entered into that kicking and screaming, but after a good amount of analysis warmed up to the concept considerably. The MDA technical contract monitor directed us to design towards a 40 naut continuous propulsive capability, 65k feet cruising altitude and 4000-10000 lb payloads with 12 to 20kWe power consumption 24/7. So those heavy, power-thirsty military payloads are an order of magnitude worse than a nice cell phone/wireless type comm relay package I imagine. Anyway, the station-keeping HAA appears to be do-able with off the shelf technologies. We focused on OTS hardware like thin film solar cells, Lithium-Ion batteries and an all-inflated architecture. It turns out that that was a terrible mistake as the Army and MDA at the time had been sold on fuel cells as an enabling technology, in fact the vast bulk of the follow-on contracts went to Lock-Mart allied firms that were pursuing fuel cell technology. So whereas my small team and I lost out, Lock-Mart has pulled in $40M and $149M contracts to further their vision of HAA. Most recent press releases mention prototype delivery and flight in 2009. So with almost $200 million spent or in the pipe to be spent in the next couple years, (I think

there is a Augustine's Law that predicts this will double or more...) I'd say the economics of a Lock Mart-esque HAA appear marginal at best, if one had a traditional business model where the development cost was amortized and paid down as revenues developed with an operational system. BUT, being a DoD-funded development, the technology development costs are "free" and it's possible that non-mil system could come from this.

However, a civilianized spin off might do much better.

These guys:
http://www.sanswire.com
have built real hardware, and have done a couple test flights, undoubtedly to altitudes far shy of the 70k foot stated max ceiling as two test flights were conducted in a day. I'll reserve my prognostications on the stratellite system until after they've done a 5-10 day station keeping demonstration flight.

So we'll see where it all ends up.

The semi-disposable balloon constellation can be up and running with modest development and capitalization, self propelled blimps will require much more development, infrastructure and capitalization.

For now the smart money is investing in the steel cell phone towers that are welded together and stuck into the ground.

- KMC

Hi Jamey,

Well, it's clear that you guys were giving it your best shot. Sorry it couldn't work for this April 8th. Keep up the good work, and glad to hear that Suzanne's not lost her spunk!

Be sure to let us know a couple of months in advance re your sked and payload particulars. Fall gets pretty slow for EOSS, compared to the summer rush, so I don't expect that we'll encounter any scheduling issues. And if you work towards late fall, the upper westerlies will prevail, which means you most likely can go out of Gene Fatton's place near Windsor.

For Ralph and Rick: pls amend your announcements accordingly, decrementing EOSS flight numbers starting with the 22 April Gateways/ DemoSat two-fer heavies out of Windsor, now EOSS-102.

We're still on track for EOSS-101 Midwinter's from Windsor on 18 April. We'll be flight qualifying two new APRS beacons, a wireless Balloon LAN and (I hope!) a fast burst-sensing balloon release device which I hope will ameliorate the Dreaded Post Burst Chaos (DPBC).

Hi Mike,

I met a couple of your colleagues at the last EOSS meeting. Names
were Eric and Roger, if I can read my notes...

Those tethered balloons need a Waiver from the FAA or must fly in
a MOA to prevent acting like barrage balloons - if they go over
200 ft AGL, that is. Not that one could erect a real 200 ft tower
nearly as fast in a tactical situation, tho!

I think the ones that are being considered for comm'l purposes
are unmanned free balloons, using air ballast and propulsion for
long-duration station-keeping above 60K'.

1975. Rockford, Illininois

Yahoo group: GPSL (2002 — 2008)
Date: 2006-01-26 20:39:03 UTC
From: Gene Harlan
Topic: 1975 Message: 1975

I sent out message to see what kind of interest there is in the Rockford, Illinois area for a balloon launch. This was instigated due to the fact that my grandson's teacher thought it would be a neat thing to do (once I suggested it to her!).

My questions on these groups is: Since there are many people that read these and not all are close to and involved in the groups with the messages, there just might be those around Rockford that would be willing to join us. If so, let me know.

We have gotten interest from the Wisconsin group to help us and a few others in the last couple of days. All details are yet to be decided.

Thanks.

How many of this group (ATV group) would be interested in a helium balloon launch? And how many others not in this group could we get?

I threw out the idea to a Christian Life science teacher, and I "think" she liked the idea (see below - and see the article I pointed to).

We would need a variety of talents to do the launch. Some of the expertise we could pull in from Wisconsin from a group that has already done many launches. And I also copied this to Kent from Schaumburg (who I met at the Wheaton hamfest Sunday) who is interested. He may be able to round up people as well.

What would we fly? I would think GPS with packet radio (so we can find it!), ATV, still pictures - either digital or film - taken every so many seconds (need a programmer), and manybe more.

Funds would need to be raised, possibly $1000 for the package, which we would hope to re-use for many launches. We have done that before and can do it again.

We will need those that can chase using APRS and find the balloon when it comes down. Flights usually last from 2-3 hours.

So, what do you say. How many are interested? Use Reply All so others can see your comments.

Thanks.

Gene - WB9MMM

From: Gene Harlan [mailto:atvq@...]

Subject: Fw: [GPSL] Re: Balloon Article

Christy,

Not to get too many things going at once, but check out this article. We have a few hams that might be interested in doing something like this locally. Might need a "little" funding from the school for the expendable
supplies. A group in Indianapolis used to do this and the school would pay
around $200 for the helium and balloon for a flight. The equipment was otherwise supplied by hams. Funds could be supplied by the parents of the
students involved?

You have to work very closely with the FAA and notify them of details of the
flight. I have checked, as I was afraid that being close to O'Hare they might say no, but they said OK as long as we followed the rules.

The specific url is:

http://www.universetoday.com/am/publish/satellites_budget.html

Just something else to have fun with!

Gene Harlan

Funds would need to be raised, possibly $1000 for the package, which
we
would hope to re-use for many launches. We have done that before and
can do
it again.

We will need those that can chase using APRS and find the balloon when
it
comes down. Flights usually last from 2-3 hours.

So, what do you say. How many are interested? Use Reply All so others
can
see your comments.

Thanks.

Christy,

Not to get too many things going at once, but check out this article.
We
have a few hams that might be interested in doing something like this

locally. Might need a "little" funding from the school for the
expendable
supplies. A group in Indianapolis used to do this and the school would
pay
around $200 for the helium and balloon for a flight. The equipment was
otherwise supplied by hams. Funds could be supplied by the parents of
the
students involved?

You have to work very closely with the FAA and notify them of details
of
the
flight. I have checked, as I was afraid that being close to O'Hare
they
might say no, but they said OK as long as we followed the rules.

I'm always interested in traveling to launch a near spacecraft. It would add another state for my Launched All States award.

Paul

>>> atvq@... 1/26/2006 1:39 pm >>>
I sent out message to see what kind of interest there is in the Rockford,
Illinois area for a balloon launch. This was instigated due to the fact that
my grandson's teacher thought it would be a neat thing to do (once I suggested it to her!).

My questions on these groups is: Since there are many people that read these
and not all are close to and involved in the groups with the messages, there
just might be those around Rockford that would be willing to join us. If so,
let me know.

We have gotten interest from the Wisconsin group to help us and a few others
in the last couple of days. All details are yet to be decided.

Thanks.

How many of this group (ATV group) would be interested in a helium balloon
launch? And how many others not in this group could we get?

I threw out the idea to a Christian Life science teacher, and I "think" she
liked the idea (see below - and see the article I pointed to).

We would need a variety of talents to do the launch. Some of the expertise
we could pull in from Wisconsin from a group that has already done many
launches. And I also copied this to Kent from Schaumburg (who I met at the
Wheaton hamfest Sunday) who is interested. He may be able to round up people
as well.

What would we fly? I would think GPS with packet radio (so we can find it!),
ATV, still pictures - either digital or film - taken every so many seconds
(need a programmer), and manybe more.

Funds would need to be raised, possibly $1000 for the package, which we
would hope to re-use for many launches. We have done that before and can do
it again.

Our 05-B flight last year had the number of states landed in exceed the number of states launched in, so you should keep track of both.

Can't say 'recovered' yet because I still have not followed up again with Cargill to see who up there has it.

I have video of our last flight traveling along the ground in MO. I think we made about 10 mph on the ground (not bad with about a 15 mph wind - lots of friction). ;-) Nick's poor capsule, won't be the same.

Don

Interesting. EOSS has launched from CO, WY, KS and IA and has recovered
from all the above, plus NE several times.

1982. Launched All States Award?

Yahoo group: GPSL (2002 — 2008)
Date: 2006-01-27 11:36:51 UTC
From: wb8elk@aol.com
Topic: 1982 Message: 1982

Hi Paul,

Launched All States award?...I wasn't aware of that one but it sure sounds like a good one....here's my list so far since 1987:

OH,IN,IL,CO,NH,ME,CT,NC,AL,GA,TN,CA,UT,KS,IA,TX,WY

Only 33 to go !!!

73s de Bill WB8ELK

Aw gee, I'm only KS,ID,OR,WA,CO,IA

Just 44 to go.

My Recovered All States are KS,MO,IA,NE,ID,OR,CO

So just 43 to go. I think that Hawaii one is going to be a tuffy!!

Paul

I would be interested in starting this award. How does getting a certificate for every five or ten states sound?

Paul

>>> manes@... 1/26/2006 10:23 pm >>>
Interesting. EOSS has launched from CO, WY, KS and IA and has recovered
from all the above, plus NE several times.

I don't know that Rockford is a real good place to perform a balloon launch due to the prevailing winds and that rather huge bit of water to the east ("splash...glugglugglug....oh oh"). Then, again, if you waterproof the payload well enough, and have a water based recovery team, it might be acceptable. Or, if you choose to launch when the winds (at altitude as well as near ground level) are blowing in another direction. Or, if you have an expendable payload.

I might be willing to drive up (from Lexington, KY), if it's at a time when I'm free. I don't have much experience with launches, although I did visit one of the Windtrax group's launch from Indianapolis, IN about 10 years ago.

> We have gotten interest from the Wisconsin group to help us and

Please keep us advised. Even if I can't make it up there to help out (as a "warm body"), then I'll listen for the signal from Kentucky.

Dave,

Great. I will keep you on the list to keep informed.

Just to let you know, Rockford, IL is 5 more hours from Indianapolis.

And, you are right, we do not want to go into Lake Michigan! There are many things that have to happen and get checked out before doing this. We may decide to drive West and North for the launch so that it ends up more in this area. There are some Wisconsin balloon-a-tics that are offering assistance. And that is good news!

Thanks.

1987. STARA - Miniature Guided Parachute Sensor Delivery from UAV

Yahoo group: GPSL (2002 — 2008)
Date: 2006-01-27 22:14:49 UTC
From: Gene Harlan
Topic: 1987 Message: 1987
Attachments: 1 described; binary payloads are missing from this source WARC

Now this is the way to get the balloons back. While it might be a little pricey since it is made for the government, they claim that this parachute will deliver a payload weighing from 50 to 100 lbs. from an altitude of up to 35,000 feet, to within 75 feet of the target. I saw this in Machine Design, January 12, 2006.

So, wouldn't it be nice to just bring our launches right back to us!

The Stara site had a link to the Cuban fabric site, which has
a new parachute material that might interest us:

http://www.stara.biz/corporate/news/news20040827.htm

Our 5ft ol' reliable standard still weighs over a lb. This Cuban
stuff could get us a few more feet of apogee? Wotchall think?

Hi Dave,

So you're in Lexington KY? Do you know any of the U Ky Eng'g
Big Blue project folks, like Bill Smith KG4YLM? EOSS has flown
their project out of Colo 3 times to date.

Who shut the projects down? How big were they, and what were they carrying?

Zack

1994. Re: [Ballooning] Re: [GPSL] STARA - Miniature Guided Parachute Sensor Delivery from UAV

Yahoo group: GPSL (2002 — 2008)
Date: 2006-01-28 16:11:28 UTC
From: Don KA0JLF
Topic: 1989 Message: 1994

1.) FAA
2.) flying across FL
3.) R/C UAV
3a.) Video - HUD for pilot to fly remotely

Above from memory, a few years old, not completely
reliable. I don't know if the website is still up.
I'll have to revive old emails.

1995. Re: [Ballooning] Re: [GPSL] STARA - Miniature Guided Parachute Sensor Delivery from UAV

Yahoo group: GPSL (2002 — 2008)
Date: 2006-01-28 16:38:03 UTC
From: Don KA0JLF
Topic: 1989 Message: 1995

Oh, I may have misunderstood your question Zack.

This was an Amateur Radio project, so it was basically a one person with friends project (kind of like the balloon thing). They were carring HAM gear.

There is a organization for the Big Boy UAV projects. They mostly do goverment and research type stuff. They have goverment approval to fly, but I don't know the details on that. There is a website for the organization, I don't recall what it is, but a google on UAV would probably find it. I'm pretty sure some of the past postings had links in them if you followed the path. As I recall there were several base projects, LTA, Helo, flying wing, parafoils, and balloon. In fact I just heard something on the radio, either this week or last, about them being used on the southern boarder and increased interest in them.

Hope this might be more of what you were asking.

Yep, I'm in Lexington, but I've lost contact with most of the
people at UK. I graduated from there, but it's been almost
20 years ago, and there aren't many people around from back
when I was going there.

Hi Dave,

Well, if you've got some ballooning experience, the U Ky Eng'g
Big Blue project might interest you, and you might be able to
give 'em hand as well. Suggest giving Bill a holler.

From: Mike Manes
Topic: 1989 Message: 1999

Hi Zack,

Not sure about Don's experience, but FAA NW Region refused to grant
a waiver for U. Ky Big Blue project to release a 15 lb autopiloted
glider from 100K'. They cited new FAA regs intended to be applied
to big stuff like USAF Predator etc flying in US civil airspace.
The rules require the bird to be equipped like an airplane, including
visual see-and-avoid techniques.

They did OK a release below 18K' VFR in Class E aispace, provided the
control op could see the glider and execute see-and-avoid maneuvers.

2000. ARHAB 2006 Awards

Yahoo group: GPSL (2002 — 2008)
Date: 2006-02-01 20:32:07 UTC
From: PAUL VERHAGE
Topic: 2000 Message: 2000

I'm almost done contacting the award sponsors.

I'll need photos of each winner with their prize. We could either do this at GPSL or you could send me a photo. Is there a preference? Personally, I think it would be great to add an award ceremony to GPSL.

Paul

Well after some early weak signal reports, no one has heard the Suitsat
for the last few hours.

NASA TV is theorizing the batteries are too cold for operation, but I'm
not sure how they know that.

If that's true, there is a chance that if the unit gets in the sun, it
might heat up and cause some transmission.

Anyway, I will be out at the shack before 10 AM to see if there's hope.

Keep checking suitsat.org for updates.

Hi K-Mark,

Well, we've never been compelled to abide the dual redundant
termination requirement for exempt flights. However, the way I
read FAR 101.35(a)(1&2) is that latex burst is (or a plastic
burst panel on a sounder) serves as a primary system for "heavies".
That's how my waiver apps put it, and they get approved certs.

Now, you ask about the UAV rules. Cheryl Brown at Region was
good enough to send me the UAV rulemaking memo, attached to
this email. It's a 108K Word file, so not sure all addess will get
it. But you will.

2007. AFS-400 Q&A

Yahoo group: GPSL (2002 — 2008)
Date: 2006-02-10 05:52:11 UTC
From: Mike Manes
Topic: 2007 Message: 2007

Hi Cheryl,

Please thank Mr. Swartz for his thorough and expedient response.

I take it then that if the air vehicle is steerable horizontally then it's considered an aircraft, regardless of power.

And since our GPS/APRS position reports are delivered in a timely fashion to the ARTCC and TRACON control floor via wxqa.com and findu.com, our balloons and any associated payloads are considered Cooperative Aircraft for purposes of AFS-400.

I've taken the liberty of copying this thread, including Mr. Swartz's reply, to a number of other people in the ballooning community who have been inquiring about some of these issues.

One remaining observation is that the scope of AFS-400, based on its definitions section, could be mistaken to be supercede FAR 101. Perhaps a future revision could make an appropriate reference to that reg, in a fashion similar to that made to AC 91-57 for model aircraft.

Thanks again!

Best regards,
Mike Manes

2012. Kaymont 1200g

Yahoo group: GPSL (2002 — 2008)
Date: 2006-02-22 16:13:22 UTC
From: Ryan Butler
Topic: 2012 Message: 2012

Greetings,

Kaymont doesn't appear to sell small quantities of balloons anymore and direct you to Scientific Sales now. However, Scientific Sales appears to be marking them up almost 100%.

The minimum direct order is 6, which is surplus to our needs. Does anyone need any Kaymont 1200g balloons that would be interested in a group purchase with us? Conversely, has anyone done a large purchase and has some extra 1200's they would like to get rid of?

Thanks

Ryan Butler, KB0JQO

2013. Re: [GPSL] Kaymont 1200g - I have some Kaysams available

Yahoo group: GPSL (2002 — 2008)
Date: 2006-02-22 20:09:10 UTC
From: wb8elk@aol.com
Topic: 2013 Message: 2013

In response to Ryan's question and to anyone interested:

I have a few Kaysam 2000 gram and 3000 gram balloons I'll let go for the price of the smaller balloons....these are about a year old and good performers and were purchased from Kaysam when they went out of business last year. The nozzle neck is a larger diameter than the 1200 gram balloons however, so plan accordingly with your balloon filler.

2000 gram: $120
3000 gram: $150

This is not good news. I usually bought 4-5 at a time at most. Agree that SS is not a great route to go with their markup. While I'm not interested in getting more balloons yet, I encourage each group to post when they're going to make a buy to see if we can get to 6.

Ryan, did you get a price from Kaymont if you bought 6?

Greetings,

Kaymont doesn't appear to sell small quantities of balloons anymore and direct you to Scientific Sales now. However, Scientific Sales appears to be marking them up almost 100%.

The minimum direct order is 6, which is surplus to our needs. Does anyone need any Kaymont 1200g balloons that would be interested in a group purchase with us? Conversely, has anyone done a large purchase and has some extra 1200's they would like to get rid of?

Thanks

Ryan Butler, KB0JQO

2017. RE: [GPSL] Kaymont 1200g

Yahoo group: GPSL (2002 — 2008)
Date: 2006-02-24 01:18:17 UTC
From: Don KA0JLF
Topic: 2012 Message: 2017

We were getting ready to order about 6 balloons,
actually I was expected to have them ordered already,
was planning on 1000 gram but we could be flexible or
coordinate with other groups for a group purchase. Was
the 6 minimum with Kaymont or SS?

2021. Re: [KNSP] RE: [GPSL] Kaymont 1200g

Yahoo group: GPSL (2002 — 2008)
Date: 2006-02-24 19:12:06 UTC
From: Stephanie Steele
Topic: 2021 Message: 2021

Can someone check and see where there might be a price break? Perhaps at a case quantity there might be some signifigant savings.

Stephanie

I have been unable to copy here in Champaign, IL but I am too far away at
this point to hear it direct and not far enough away to have any skip. Bummer.

From: wb8elk@aol.com
Topic: 2033 Message: 2033

Apparently the APRS transmitter got too cold and has now warmed back up...it's now transmitting again if you check FindU, you'll see it right at the HF position that W0RPK sent earlier.

It's up on a mountain in a Wilderness area overlooking Erwin/Banner, NC....looks like they can get within a half mile of it though.

I will have my PSK31 signal on 14.0625 MHz today from 3:21 CST until about 5:00 pm CST, maybe later....if anyone hears it, please email me at : _wb8elk@..._ (mailto:wb8elk@...)

- Bill WB8ELK

2035. UX-7 parachute can be seen but going to tough to get to

Yahoo group: GPSL (2002 — 2008)
Date: 2006-02-25 21:54:19 UTC
From: wb8elk@aol.com
Topic: 2035 Message: 2035

David KE4FGW called and said from the highway he can see the orange parachute near the top of the mountain across the river (with white water rapids no less - you can see the rapids on the aerial photo)...it's way up on a tree.

They are contacting the owner of a private road that gets within a half mile on the payload side of the river but it will still be a very tough hike.

Dan and the team of payload recovery bandits are making there way along side the west bank of the Nolichucky River just south of where UX-7 is located. They were passing the Devil's Looking Glass at around 3:08 PM. They still have to climb the mountain and return by sunset. Good Luck!

Dan and crew left Knoxville around 10 AM. They have arrived on the sceen at the spot along TN81 that you can visually see the parachute from. From here they will plot out a plan and attemp the recovery of UX-7. Sounds like they may head south to S. Indian Creek Rd and go in that way. From the end of this lady's driveway, the payload is approx. 0.8 of a mile away. They'll have some heavy hiking to do as the payload sits on another ridge to the north of this one they are going to hike up on with a valley and a creek between the two. Let's hope they don't run out of daylight hours.

Date: 2006-02-27 02:50:03 UTC
From: David Hoffman
Topic: 2041 Message: 2041

At around 4:50 PM EST, Dan and the group were heading back down from the site of the payload without the payload. They did however put an eyeball on it but just couldn't get to it. They got up to almost right underneath the payload and made several attempts at it but was running out of daylight hours to safely return. The payload is up very high in some very tall trees. They will have to try again at some later date. Perhaps this Saturday, they will try again. With some climbing equipment, maybe they will have better luck next time.

We had a similar experience last year. Ours landed
about 80 ft in the top of a tree. We got very close
with a slingshot several times. As I remember I think
the tree limb finally gave way after the parachute had
snapped open on it after several hours. I'm not sure
th e line didn't cut throught the limb and then the
parachute opening broke the branch. There is a slide
show of the sight (across the river from Fort Riley)
at: http://www.habitatskylab.org/HS05D/slideshow/

No I'm not a tree hugger, we want to get an idea of
the tree size. It was a BIG tree. ;-)

Hope you have lots of luck getting it back.

Announcing
SmallStat 2006
A conferenece on Small Balloon Science, Technology and Operations
18 - 19 September 2006

Conference Web Site: http://www.ia.spacegrant.org/smallstat/

This event is open to Researchers, Students, Amateur Radio
balloonists or anyone interested in small balloon
activities. Distinguished speakers from Government (including FAA,
NASA, NRL and Air Force), Industry, and Academe will present in
plenary session as well as invited speakers in technical sessions
(see web site for Call for Papers). Please broadly distribute this
announcement and encourage abstract submissions.

The event includes a STUDENT POSTER SESSION with a top prize of
$1000, $750 2nd place, and $250 3rd place. A huge corporate
recruiting event with over 200 companies is held in conjunction with
this event.

I hope to see you and your colleagues there.

Bill Byrd
Conference Host

2045. Re: [KNSP] RE: [GPSL] Kaymont 1200g

Yahoo group: GPSL (2002 — 2008)
Date: 2006-02-28 16:11:44 UTC
From: Ryan Butler
Topic: 2021 Message: 2045

The next break is at a case (18 pieces) which makes it $60/balloon

If anyone is close to Kaymont and could pick them up, maybe they would be better at ordering and distributing to save on multiple shippings, otherwise, for an order this large I'd need to see some or all of the money up front as I don't have a grand or more (with shipping) to float for this.

Thanks

Ryan, KB0JQO

2046. Re: [Balloon_Track] Near Space modeling

Yahoo group: GPSL (2002 — 2008)
Date: 2006-03-01 05:58:55 UTC
From: Mike Manes
Topic: 2046 Message: 2046

Hi Mike,

One of the most vexing aspects of high altitude ballooning is the
Dreaded Post Burst Chaos (PBC), which so far has evaded canonical
explanation, altho theories and some empirical "fixes" abound.

In worst case PBC, we have got on-board images of the parachute
BELOW the horizon, and there have been several instances of payload
line separation due to overstress as well. Even JPL has been bit
by PBC. Jack Jones told me that it got so bad on one flight that
the bottom of the payload string actually fell down into the top
of the parachute canopy, and whole shebang made a sizable dent in
the ground on landing.

My theory is that it's related to parachute instability at high
altitude, possibly due to transonic flow thru the vent and exacerbated
by balloon shards tipping the 'chute. High-Mach drag rise over "boxy"
payloads may also contribute, and putting the lowest-drag payload at
the bottom to serve as sort of a plumb bob seems to help. And releasing
the balloon lift line IMMEDIATELY on burst also seems very helpful,
as revealed on EOSS-101.

So if you have access to high-Mach aerodynamic modelling, you might
consider taking that on.

I'm sure that TVNSP will jump in for some to help make the 18 quantity. How about it TVNSP members, anyone want to get some at $60 each? Ryan, put me down for two and send me me the PayPal info or however you want payment.

Haven't forgot about everyone, I'll send out an email about getting balloons on Sunday hopefully. Just a note to let eveyone know I didn't disappear.

Thanks for all the input.

Launch at 1:45 pm....however, the PSK31 payload has a problem, so instead I'm flying the WB8ELK-12 APRS payload on 144.39.

Ed in Bermuda....It will probably be sunrise before the payload gets within 2 meter range of you.

http://map.findu.com/wb8elk-12

2055. The WB8ELK/ES-OS balloon has lifted off from Falkville AL Sat Mar 4 at 2 pm CST

Yahoo group: GPSL (2002 — 2008)
Date: 2006-03-04 20:37:00 UTC
From: wb8elk@aol.com
Topic: 2055 Message: 2055

The WB8ELK-12 zero pressure ES-OS balloon lifted off at 1954z during a brief lull in the wind gusts....we inflated it inside the barn and brought it outside covered with a plastic drop cloth....winds were actual very light at liftoff as I can attest from the rope burn on my finger when I expected to go one way and it decided to go the other.

It's ascending around 660 ft/min at the moment.

http://map.findu.com/wb8elk-12

There is no PSK31 on this flight as the payload has intermittent problems.

The 100 foot long flight train configuration consists of a 1 pound sugar cube ballast at the end....a float 50 feet up the line and then the payload. It's hoped that it will splash down in the Ocean within digipeater range (reason for the 2 pm liftoff)...if the ballast works then we'll know if it's heard again by the digipeaters along the coast.

73s de Bill WB8ELK

This will be a long duration flight provided the balloon achieves float.

2056. WB8ELK-12 balloon has been found in a parking lot at a technical school in GA

Yahoo group: GPSL (2002 — 2008)
Date: 2006-03-05 06:08:44 UTC
From: wb8elk@aol.com
Topic: 2056 Message: 2056

As I was looking at the aerial photo of the coordinates that Sam KD4SHK emailed me from what he saw on the local APRS digis (lower than what showed up on FindU)....I saw that it appeared that the balloon had landed in a parking lot near a technical school south of Thomaston, GA.....a few minutes later, my cell phone rang and some very drunk students called me asking how much the Reward was.....they had just gotten back from a drag race and were very very drunk....from what little I could understand, they said the balloon (they called it a big- a@# trashbag) was tangled up in a tree and shredded but they found the payload sitting in the parking lot behind Flint Technical College south of Thomaston, GA (south of Atlanta).

Several drunk people passed the phone around and asked me questions about. Hopefully after the hangovers tomorrow, they'll call me back and I can arrange to retrieve it.

Last known coordinates very close to landing relayed by KD4SHK:

32d 51.680m
84d 19.030m
764 feet

Okay,

I poured over all the emails I had gotten on this and came up with the following:

Group
Balloons
Unit Price
Total
Contact
Email

CNNSP
2
$70.00
$140.00
rahammond@...
WZ4O
2
$70.00
$140.00
lgriffin@...

TVNSP
2
$70.00
$140.00
kc7dba@...
ARBONET
2
$70.00
$140.00
W5BL@...
Mike
1
$70.00
$70.00
upand_at_them@...
CIBE
2
$70.00
$140.00
rbutler@...

11
$70.00

$770.00

We haven't reached the 18 break point yet. Also not included is
shipping to your location or the shipping to get the balloons to me.
I'm guessing on such a large order of balloons it'll raise the price of
each balloon a couple bucks, but once I know how many we're getting I'll
ask Kaymont for a shipping quote and relist the updated costs. I
haven't decided if it'll be actual cost or flat rate for the reship out.
On such a large order maybe Kaymont will throw in free shipping.

Anyhow, we need a commitment of 7 more to get the additional price
break, if I missed your email or if you think you could do with more,
let me know!

Thanks

Hey Ryan,

Thanks for the feedback on the balloons. One quick question, I thought is we reached a quantity buy of 18 balloons the price dropped to $60 per balloon. Did I miss something? In any case, let me know where we need to send the check to once we have an understanding of the shipping costs.

73,

Doug, W5BL

Subject: Re: [KNSP] RE: [GPSL] Kaymont 1200g

The next break is at a case (18 pieces) which makes it $60/balloon

If anyone is close to Kaymont and could pick them up, maybe they would
be better at ordering and distributing to save on multiple shippings,
otherwise, for an order this large I'd need to see some or all of the
money up front as I don't have a grand or more (with shipping) to
float
for this.

Thanks

Ryan, KB0JQO

That is true the price does drop to 60 for quantities of 18 or more, however we are at a quantity of 11 right now, so the price reflects the 6-17 price break. If we get enough interest to hit the 18 mark, The price will reflect that.

2061. [Fwd: [UTARC Chat] UX-7 Recory Attement #4]

Yahoo group: GPSL (2002 — 2008)
Date: 2006-03-06 18:24:48 UTC
From: David Hoffman
Topic: 2061 Message: 2061

Bill, I heard about your balloon flight. But I was on top of Unaka Mountain trying to retrieve the UX-7 payload from last weekend. Below is the story:

David Hoffman - KE4FGW

---------- Original Message ----------
Subject: [UTARC Chat] UX-7 Recory Attement #4
From: "Jonathan" <jculver1@...>
Date: Mon, March 6, 2006 6:06 pm
To: "UTARC MAIL LIST" <chat@...>

Friday:
Got gear together and ready to head out on Saturday. Made a few last phone calls to see about securing a raft from a Contact that Greg had made in Bristol.

Saturday:
Well I had secured my own vehicle and Tom Ogle, his son (Thomas) and David Hoffman
Set out early to find a place to camp and size up the payload once again. As they pulled off the road to spot the pay load and gaze at it with binoculars, one of the Unaka Mountain Search and Rescue Team vehicles pulled. A man stepped out and was looking with his binoculars also. Well Tom and David's Curiosity got the better of them and they walked over to the man and asked, " what are u looking for?" Sure enough he was looking for what they were looking for the payload.
After some Talking Tom and David not only secured us a raft and the County's search and Rescue but found us a camp site right behind the logging company, witch also conveniently was where the Search and REscue team launches there raft from.
So i arrived about 5ish and meet Tom, his son and David at the barbuque restaurnt. And we all had dinner. And for those how attempted the recovery the weekend before, the barbaque is good and it wasn't just our hunger speaking. We headed back to camp where i met the Duck! (it was actually a canidiain goose but we just called it a duck so much easier). This duck was insane it tried to attack my car and it tired to eat Thomas and almost ran off with Davids shoe. But we managed to survive that and once we got to our camp site the duck left us alone as long as we didn't get to close to it again. ONce back at our Camp we built a fire and stayed in front of the fire until we decided to head to bed. (time unknown) We believe that it got down in the teens Saturday night but we all survived the dreaded cold.

Sunday
WE got up and had some pop tarts and frozen granola bars that we heated with the fire that Tom had gotten up early to build. (before 7am) The Search and Rescue Team came right around 8am as they had promised. The also brought us some coffee and some busicuts from hardies. Well as part of the team was getting ready the Older lady (the mom of the team) was attacked by our friendly neighborhood duck. several phrases where repeated like "Ill Kick your But!!!", "Dont do it!!", "no No NO NO!!!" all of these were accompanied by a moving foot and the 1st phrase was repeated more than the others. The duck finally left her alone.
We started off at about 830 across the river fully suited and everything, Life jackets, and Helmets, and oars. For most of the team this was our 1st White Water Rafting Experience. They also explained to us alot of the dangers in the river and really made me hope that when mike when last Tuesday that they at least had life jackets on. This apparently isn't a very friendly river and by the looks of the rocks as we rowed across i would agree with them on that.
The left us one of there men and we started up the steep steep trail to the payload. I will note that the path from the Hillmans Property was alot easier to access the payload then the way we went. We where having to us trees to support our selves up the hill. and it was lot harder on our ankles and knees than the other way.
2hours later we got to the payload and started to attempt to shoot a line w/ sling shoots at/through/near the payload and the parachute. We got a line thought the hoop of the parachute but when we tried to bring a stronger line thought it it would pass through and after several attempts with the cord provided we snapped the line. We then tried to secure a line in a tree so that Tom could use some of his equipment to climb up his repleing rope. Same thing happened. By this time we where all tired and Tom had somewhere else that he Had to be. We tried for about 3-4 Hours to get it down and we where unsuccessful. We headed back to our pick up point and radioed in for our raft to come back and get up.
The Unaka Mountain Search and Rescue Team are all licensed HAMs and they use HAM frequencies for a lot of there operations so that they don't tie up the public frequencies (sheriff, fire, etc.) So as we where heading up the mountain they asked us to check in so we all checked in as we headed up the mountain and there were a few people who actually got back on the repeater and said oh hey what can we do to help. well to bad they where not willing to bring us a lunch on the hillside but we all got a few qso's in and had some fun.

Things for Next time (if there is one)

* A Bow and arrow w/ a line attached
o line that is high test line
* braided nylon rope
o there was some nylon sting there that was just twisted and it would get caught in any little thing and it tangled up like non other
* Possibly some type of fire arm to shoot down the payload by either destroying the parachute or hitting the line
o several safety measures would need to be put into place for

this one.
* climb the trees and use that for a better vantage pt. to either
sling shot a line across or cut a limb off.
* cut the branch off.
o we rand out of time but if u could get a line across the
branch up there and use the little saw that is in the stump in
that area u could possibly cut the branch down. yet again u
will want to use braided nylon rope.

If we do this again it needs to be something that we plan on spending all
day on. bring in a packed launch, water to last the day, and a lot of
weights or rocks if u are going to use a sling shot. I would NOT CROSS
THE RIVER WITHOUT the help of trained knowledgeable people, whither it be
the Unaka Mt. Search and Rescue Team, or someone else!! THE RIVER IS VERY
DANGEROUS!!

We didn't recover the payload but we did have some fun and we definitely
made some contacts. The search and rescue team has been challenged to get
it down but they have also offered to take us across the river again.
possibly at a different point i hope. We left the area saying wow we hope
a nother one lands in this area. All the people were very friendly and
helpful once u convince them that u are not drug dealers. If anyone would
like to do it agian please let me know i would like to go up there again
its a fun but tough adventure. Let em know if u have any other questions.

From: Steve KA5YFC
Topic: 2051 Message: 2062

Habitat SkyLab will take seven which should bring the total to 18. This should get us the $60 price if I remember right. Let us know what the S/H is so we can get that figured in also.

Let me know where to send the monies. Do you take PayPal?

Before you get this all wrapped up and an order placed, you might verify how many are wanted. I think you undercounted TVNSP as three of us (myself, Dan, and Jeff) spoke up for balloons for what I thought was a total of 6. With the others I have seen, and these seven, along with ours, you might end up at the next price break point (assuming there is one) with some luck. Ditto on the shipping.

Actually, I didn't order any. I already have balloons from last year.
But Dan did ask for two.

2065. Solar tetroon Sky Diamond 9 aloft

Yahoo group: GPSL (2002 — 2008)
Date: 2006-03-07 14:31:04 UTC
From: Rochte, Robert
Topic: 2065 Message: 2065

Sky Diamond 9, a 2500 cubic foot solar tetroon constructed by fifth grade students at the Grosse Pointe Academy, is aloft now. This is our first operational test of a balloon built with adhesive tape - wish us luck!

The balloon can be tracked here:

http://www.findu.com/cgi-bin/find.cgi?call=kc8uch-11

And here:

http://db.aprsworld.net/datamart/switch.php?call=kc8uch-11&maps=yes

73,
Robert KC8UCH

With the additional 6 plus Paul Verhage's 2 and the nstar 2 (if they're still interested) that should put us around 23. I've asked Kaymont for a shipping quote and am waiting to hear back.

From: Hank
Topic: 2051 Message: 2068

Ryan,

I sent you email yesterday to tsss.org but it bounced.

I'm wondering if you could ask Kaymont what a 200 gram balloon would cost if it were added to this order.

There may be no cost advantage and maybe it has to be a minimum number of each size balloon anyway.

This is an excellent idea to do a group buy with the new Kaymont sales policy and I'm glad there has been such a good response.

Hank

Robert,

Tremendous. Very stable altitude and just passing Pittsburgh
on its way across Pennsylvania.

It will be great if it comes down on land.

2071. Re: [GPSL] Solar tetroon Sky Diamond 9 aloft

Yahoo group: GPSL (2002 — 2008)
Date: 2006-03-08 00:15:10 UTC
From: Joe
Topic: 2065 Message: 2071

awesome flight so far,!

Congrats!

And from someone who landed once in Ohare,, Hope it makes it to the
ground before it flies over DC, wonder what they'll say or think about
that?

Joe

2072. Re: [GPSL] Balloons

Yahoo group: GPSL (2002 — 2008)
Date: 2006-03-08 16:11:06 UTC
From: Ryan Butler
Topic: 2051 Message: 2072

Okay

Here's the final stuff as I have it, please let me know on inaccuracies:

CNSSP 4 - $243.64
WZ4O 2 - $121.82
TVNSP 2 - $121.82
ARBONET 2 - $121.82
Mike 1 - $60.91
CIBE 2 - $121.82
Hab/Sky 7 - $426.36
Paul 2 - $121.82

This reflects a $60 per balloon plus $20 in shipping from Kaymont
divided by the number of balloons multiplied by the number of balloons
you bought.

This does not reflect the reshipping. For most everyone, it's gonna be
between $6-$10 UPS ground, for the large orders, it could be upwards of
$30. I can also check USPS if that's what everyone would prefer.

We can do this in one of two ways, you can paypal or money order me the
amount shown above and then a 2nd one when I calculate actual shipping,
or you can just tack on $10 if you're ordering 1 or 2 balloons, and $20
if you're ordering more than 2. I can refund the excess if you like.

If you're paypal'ing, rbutler@... is where you can send it to.

I'll order once I have enough to get them here.

Questions, comments?

Ryan

Hi Ryan,

TVNSP should be 4, two for me and two for Dan. Thanks.

Stephanie

The information contained in this e-mail message is private and confidential information intended only for the use of the individual or entity to whom it is addressed. If the reader of this e-mail message is not the intended recipient you are notified any disclosure, dissemination, distribution, copying or the taking of any action based upon the information contained in this message is strictly prohibited.

de recta non tolerandum sunt

****

...and for those who just can not get enough tag lines:

IMPORTANT: This email is intended for the use of the
individual addressee(s) named above and may contain
information that is confidential privileged or unsuitable
for overly sensitive persons with low self-esteem, no
sense of humor or irrational religious beliefs. If you are
not the intended recipient, any dissemination, distribution
or copying of this email is not authorized (either explicitly
or implicitly) and constitutes an irritating social faux pas.
Unless the word absquatulation has been used in its
correct context somewhere other than in this warning,
it does not have any legal or grammatical use and may
be ignored. No animals were harmed in the transmission
of this email, although the kelpie next door is living on
borrowed time, let me tell you.

Those of you with an overwhelming fear of the unknown
will be gratified to learn that there is no hidden message
revealed by reading this warning backwards, so just ignore
that Alert Notice from Microsoft. However, by pouring a
complete circle of salt around yourself and your computer
you can ensure that no harm befalls you and your pets.
If you have received this email in error, please add some
nutmeg and egg whites, whisk and place in a warm oven
for 40 minutes

I think I had CNSSP and TVNSP backwards, I believe CNSSP asked for 2,
and you 4, so swap those numbers :)

Thanks for catching it.

Ryan

I could use a couple also, if it's not too late yet.

Haven't read the group in a couple weeks as I've been out of town.

From: Gene Harlan
Topic: 1887 Message: 2079

It is about time to start putting together the Spring issue of Amateur Television Quarterly. I will need articles by April 1st. Please email me and let me know what will be on the way.

The Spring issue will have information about ATV get togethers and meetings at the Dayton Hamvention. We will be in booth 207 with lots of ATV stuff to show and tell and sell! Hope to see you there.

Thanks.

Perhaps an article on the 2006 GPSL?

I wonder if it might be worthwhile to have a flyer on GPSL (and maybe ARHAB in general) available at Dayton. That might help get the word out.

Sounds like I need to get going on finalizing some of the details.

As I recall on GPSL 2006, with one possible exception, everyone was in
favor of assessing a "landing fee" for people who attend the symposium?
It would also mean that we would be expected to stay at their hotel,
(however they have told me that they can't/don't ENFORCE that rule).

Unless there is further discussion, I will get back with the hotel later
this week and we can start putting together marketing materials.

I forget the details on this discussion. Was the idea to assess a fee per participating group, or per attendee at Friday's sessions?

I also can't remember where we ended up regarding the cost, either.

I think something like $5/person for Friday is reasonable, with 18 and under exempt. If we had something like that at GPSL 2005 that would have generated about $300 or more. We did a donation can which worked well but we had less overhead to cover.

Many conferences I attend charge $30-$50 per day per person for attendance to cover the overhead. I don't think we need to do that, but we should keep in mind the typical cost of something like this.

Personally, I think those that attend should pay. I don't understand why you charge those that fly. In the past it seemed there were people that attended but did not fly. As well as people that flew, I being one of them, that did not attend.

Those of us that flew, covered the costs we generated, i.e. Helium, balloons. I don't see why I, or others like me, should have to pay for a hotel I didn't stay at.

However, I'm not in charge, and my opinion is just that my opinion. For what it's worth.

I hadn't intended to charge a group that didn't attend the symposium - I just hadn't thought of that scenario. (But you really should attend -- you're missing out on a LOT of great information.)

My intentions were for the balloon groups to cover the cost of the gathering, so as not to discourage a non-balloonist from checking us out and see what all of the fuss is about.

Maybe I'm wrong (and if so, feel free to tell me), but I think that the GPSL group is growing large enough that it's about time to start taking things to the next level in terms of conference rooms, give-aways, advertising, etc.

From: David Hoffman
Topic: 1887 Message: 2091

I came to GPSL mostly as a spectator in 2005.? I've chased many of Bill Brown's flights and therefore also chose to be identified with Bill Brown as a group.? Even though I spent nearly $1000 for everything to make this trip possible, I wouldn't have minded pitching in a small fee for the conference room.? I would hope though that we try and keep the cost down and choose the conference rooms accordingly.? That was a very expensive trip as it was, so we need to be very careful on how expensive all the goodies become.? They all do add up.

2092. [Fwd: [GPSL] Opinions on GPSL 2006 - I need some feedback]

Yahoo group: GPSL (2002 — 2008)
Date: 2006-03-15 03:22:32 UTC
From: Zack Clobes
Topic: 2092 Message: 2092

Here's my email that I sent out back in November that should help refresh people's memories.

I'm looking at $25 per group who attends the Symposium to cover those costs. We could also do a $5 per head, but like I said, I'm afraid of scaring off someone who would otherwise check us out.

Zack

Reply-To: GPSL@yahoogroups.com
To: group gpsl <GPSL@yahoogroups.com>

As was decided over the past couple of months, GPSL 2006 will be held in Hutchinson, KS on the weekend of 4-6 August. We plan on following the traditional schedule of symposium on Friday (4 Aug), flight on Saturday morning, and a rain-date of Sunday morning.

Hutchinson has a brand new (more or less, it's a long story) convention center in town that is part of a nice hotel, and includes an indoor water park. (http://www.grandprairiehotel.com/)

I have contacted Grand Prairie regarding use of a conference room. It basically boils down $125 for the Symposium on Friday, assuming we eat a meal or two at the restaurant. The obvious choices for that meal would be the Thursday evening "gathering" and the Friday lunch.

"Group" room rates are $79 + tax per room night. This includes access to the water park as well as high-speed Internet. We would be expected to reserve approximately 30 rooms for Friday night.

Food prices a little on the high end - think Applebees + 20%, although the serving size is probably 20% larger also. And very good food I might add.

They've agreed to provide water, and allow us to supply our own candy dishes during the Symposium. There is the restaurant that is 100' down the hall, and also a pop and ?candy? machine on premises.

THE QUESTION IS, DOES THE GROUP WANT TO COMMIT TO SPENDING MONEY FOR THIS EVENT? I will keep prices as low as possible, but I'm toying with the thought of charging each flying group a ?$25? "landing fee" to attend the event.

2093. Bubble wrap survival at altitude

Yahoo group: GPSL (2002 — 2008)
Date: 2006-03-15 07:10:22 UTC
From: Mike Manes
Topic: 2093 Message: 2093

Hi Russ,

At the EOSS meeting tonight, we discussed various ways to protect the stainless tubing in the NOAA aircore sampler from damage during landing and a possbible parachute drag. In keeping with the plumb-bob theory of PBC avoidance, we agreed that flying the sampler at the bottom of the flight string in a "tire swing" orientation would have best chance of success. The flight profile is to carry it to at least 80,000 ft (about 30 mbar) where the balloon would be cut away.

For those who weren't there, the sampler is a 75 meter length of 1/4" OD 10 mil wall stainless tubing formed into a 14 lb coil about 3 ft diameter. A wall puncture or a crimp could render the sampler useless.

Perhaps the lightest-weight scheme suggested was to wrap the sampler in "bubble wrap". However, there were some concerns that the bubbles might burst at the low ambient pressure, thus rending it useless for protection on landing or even contaminating the collected air samples. I agreed to test some samples of used bubble wrap in the EOSS altitude chamber.

Samples tested:

Large clear bubble (LCB): 30mm diameter bubbles of clear polyethylene on 33mm centers. A sheet of 18 intact bubbles was cut from the source.

Small clear bubble (SCB): 8mm D bubbles clear poly on 11mm centers. A sheet of about 60 intact bubbles was selected.

Small pink bubble (SPB): same as SCB, but made from pink tinted antistatic material.

Method:

All bubbles in each sample were tested for patency by finger pressure before the test.

All three samples were then inserted into a large clear plastic roasted peanut jar and capped off. The jar and cap were vented with single 3 mm holes. The jar was intended to contain possible explosive bubble failures, thus avoiding damage to the chamber.

The sample jar was then placed in the altitude chamber, which was then pumped down to 1.2 Torr (> 140,000 ft MSL std) at room temperature. After about 2 minutes at 1.2 T, the chamber was vented to local amvient, and the samples retested for patency.

Results:

The samples were viewed during pumpdown. All bubbles appeared
quite distended above about 400T. All remained visibly intact
until 30T, where several of the LCB's opened up non-explosively.
at 10T, several more LCB's failed, and some of the SPB's appeared to
lose distension.

Post test pressure test:

Sample bubbles % bubble failures

LCB 18 33
SCB 60 0
SPB 60 90

Conclusion:

Pink anti-stat bubble wrap is a poor choice for mechanical
protection after a trip to near space, although it may still
provide anti-static protection where needed.

The large bubbles lost much of its protective property but may
be useful if two or more layers are applied.

The small clear bubbles fared best, and may be the best choice
for this application.

Further research:

This experiment did not examine the effects of exposure to tropopause
temperatures, and it is reasonable to expect that cold embrittlement
of the polyethylene film may yield less favorable results. The EOSS
altitude chamber is not provided with means to maintain such
temperatures during pumpdown, but tensile or pressure testing at
surface pressures may reveal the potential impact of this envronmental
variable.

Hi Zack,

I don't mind contributing $25 for my group (basically anyone who helps with the launch, chases my balloon or comes to observe is part of the group), however that being said I don't think a $5 entrance fee is going to scare off anyone from attending as superb of a conference as GPSL (besides donuts and conference rooms aren't cheap), it's a drop in the bucket compared to the cost of traveling to Kansas to attend and a true bargain when many conferences of this magnitude have fees of $50 or more.

I remember this email.? As I recall, I was hoping to wait and see what the rest of the crowd thought about it before I made any comments.? I would venture to guess that everyone else is waiting for the same to happen.? I don't recall see any comments so I guess I'll start?then.
Since?my daughter joined me last year and has a good chance of joining me again this year, I think there is some value in taking advantage of Zack's hotel recommendation of using the Grand Prairie Hotel for this year's GPSL.? I therefore would be in favor of making a reservation in the "group" name for this event.? I may be looking at Thursday, Friday and Saturday night.? It could be 3-4 days worth depending on my plans.? I may stay till Monday.

Hi Mike,

Interesting writeup on your bubble-wrap experiments. How long did it take to reduce the pressure to 1.2 Torr? It's possible the failure rate would be higher for a faster pressure change.

Would a box of 3/4" styrofoam (or whatever it's called - the pink or blue stuff in 4'x8' sheets) be suitable? Gluing and taping the seams with the appropriate adhesives should provide enough strength for landing. The weight is obviously more than bubble wrap, but the strength is better and there's a lot of experience to indicate it retains that strength at low pressure/temperature.

Hi all. Well, I feel that we should help with the expenses of the
forums, and meeting places. Whenever I have gone to other events I have
always been willing to pay for that experience. If it gets too
expensive, then I won't attend. Let me know what it costs and I will
contribute, pay, whatever, a resonable fee. Benjie W0CBH

Hi Mark,

It only took about 5 minutes to pump down to 1.2 Torr. The chamber
uses a 1/5 HP Welch vane pump.

Great idea re using building foam board! The 1" thick stuff would
probably do just fine. It'd take some fabrication to form it around
the coil, but that shouldn't take too long.

Mike,

Great info on the bubble wrap test...I've used the small clear Bubble-wrap numerous times for the primary insulation on my 50 milliwatt FM beacon on 2m with a 9-volt lithium taped to a wood stick and a vertical wire dipole (total payload weight of about 3 ounces)...three layers of it held in place by duct tape makes for a very lightweight cover and seems to do the trick in keeping the payload warm during daytime flights...I haven't quantified the temperature performance of this simple cover yet but will do so soon on my next flight or two.

The SCB (small clear bubbles) always seem to be intact (with only a couple of pops) when I recover the payloads....the highest test flight with this system that was recovered was 111,000 feet.

Thanks for an interesting experiment,

- Bill WB8ELK

Those are some tough bubbles! It would be interesting to see a pic at altitude to see how big the bubbles get. On the ORB-7 flight that went to an estimated 50-60kft I flew a pong-sat that had some micro-balloons. Some were just taped to a piece of cardboard others were mixed 50-50 with epoxy. The ones in epoxy survived, but the ones that were just taped to cardboard were all broken.

Hey everyone, I have a question,,

I'm horrible in math,,so here's the question,

at average altitudes,, say between 80K and 100K how much is the vacuum
at that altitude, not in millibars,, or psi's but in torrs

in other words, at say 90K is there more air at that pressure level,,
or at this figure,,,,

5 x 10(-4) torr

I always hated that negative exponent stuff.

so with that number,, which has more air molecules, 90K or a vacuum level of
5 x 10(-4) torr,, and how much difference is it?

Joe
5 x 10(-4) torr

Hi Bill,

I sure is nice to be able to simulate at least part of the apogee
conditions in the comfort of my lab! And I can see what's going
on there as well. I just posted a few crummy pix of the chamber
to GPSL for Hank Riley - not sure GPSL takes 'em.

Hi Hank,

Well, t'aint much to look at -- but I think Merle might have
taken some high res digital shots of it in an early stage of
completion, and those may be somewhere on the EOSS web site - Rick?

I just took these snaps with my crummy little webcam, attached
as 4 jpegs. Good enough to give you an idea of what it looks like
and what it does. The digital guage reads in Torr (mmHg), as does
the W&T 0-50 guage inside. The Stokes guage is considered a primary
standard, and as you can see, the actual max vacuum is about 0.5 Torr.

Hi Harry,

I guess I was expecting the bubbles to pop with a loud report, like when you step on a sheet of 'em. But I guess 15 psi is a lot lower than what's produced that way. They did puff out nicely in the chamber, but when they failed, they just kinda gradually ripped open and slowly deflated.

Hi Joe,

Well, we never get down to 5 x10^-4 Torr. Normal MSL pressure
is 1013 mbar or 760 Torr or 29.92 inHg or 1000 HPa - wotever.
As a rule of thumb, the barometric pressure on Earth drops by
a factor of 10 every 50,000 ft. So at 50K', it's about 100 mbar or
76 Torr, and at 100K', it's 10 mbar or 7.6 Torr. (BTW, Torr = mmHg).

5 x10^-4 Torr is the baro at about 315,000 ft MSL - the REAL edge of
space.

From: Zack Clobes <zclobes@...>
Reply-To: GPSL@yahoogroups.com
To: group gpsl <GPSL@yahoogroups.com>

As was decided over the past couple of months, GPSL 2006 will be held in Hutchinson, KS on the weekend of 4-6 August. We plan on following the traditional schedule of symposium on Friday (4 Aug), flight on Saturday morning, and a rain-date of Sunday morning.

Hutchinson has a brand new (more or less, it's a long story) convention center in town that is part of a nice hotel, and includes an indoor water park. (http://www.grandprairiehotel.com/)

I have contacted Grand Prairie regarding use of a conference room. It basically boils down $125 for the Symposium on Friday, assuming we eat a meal or two at the restaurant. The obvious choices for that meal would be the Thursday evening "gathering" and the Friday lunch.

"Group" room rates are $79 + tax per room night. This includes access to the water park as well as high-speed Internet. We would be expected to reserve approximately 30 rooms for Friday night.

Food prices a little on the high end - think Applebees + 20%, although the serving size is probably 20% larger also. And very good food I might add.

They've agreed to provide water, and allow us to supply our own candy dishes during the Symposium. There is the restaurant that is 100' down the hall, and also a pop and ?candy? machine on premises.

THE QUESTION IS, DOES THE GROUP WANT TO COMMIT TO SPENDING MONEY FOR THIS EVENT? I will keep prices as low as possible, but I'm toying with the thought of charging each flying group a ?$25? "landing fee" to attend the event.

Mike,

Thanks very much. The pictures are good enough to make me
marvel at what kind of instrument EOSS has!

I'm sure there are many inquiring minds who would like to
know more of the story about how this rig came to be. If
this was made from components, and the chamber made by someone
in EOSS, my compliments to all involved.

For starters, how thick are the chamber walls and what
specific type vacuum gauge is the digital one? How long has
EOSS had this contraption?

Hank

2112. On-Line Balloon Track

Yahoo group: GPSL (2002 — 2008)
Date: 2006-03-16 20:59:29 UTC
From: Troy Campbell
Topic: 2112 Message: 2112

All,

We've written a balloon track program in perl and published it on our web site. It's based (roughly) on the original gwBasic program by Bill Brown, WB8ELK. Rick von Glahn tells me that Balloon Track for Windows is based on the same code and it appears that the resulting course tracks are very similar.

The biggest advantage is that you don't do any cutting a pasting, etc to get weather data. It uses www.noaa.gov/ready/cment.html for it's data source and doesn't require much manual intervention. That's also the downside. You can't enter your own data. (We're working on that.) The Google Maps(tm) interface is very good (thanks to Keith Kaiser, WA0TJT) and you can download a TNC formatted file or XML file. The track file is in GPS text format, but we hope to have a an APRS formatted version this summer. We also are planning to enable uploading existing track files an plot them.

Now if I could just get a T-1, or cable or DSL in my chase vehicle.....

Anyway, you may find it useful or at least mildly amusing.

It's at http://nearspaceventures.com/w3Baltrak/readyget.pl

Troy, KC0MIC

Relax. Yahoo! Mail virus scanning helps detect nasty viruses!

2113. RE: [GPSL] Bubble wrap survival at altitude

Yahoo group: GPSL (2002 — 2008)

From: Rick von Glahn
Topic: 2093 Message: 2113

Hmmm,

When I saw Mike's comment/review about the bubbles, I thought it might be nice to have a spreadsheet that calculated a bunch of balloon related pressure altitude stuff. I don't speak Torr and wanted to figure out pressure values in other measurement systems. So, I made one:

http://www.eoss.org/balsoft.htm ... bottom of page.

It thinks:

12.74669507 Torr = 90,000 feet

Attributions for formulae and conversion factors on the spreadsheet. If I've massively messed up somewhere let me know but apparently there is still a whole number component to Torr values at 90K, not a minuscule fractional amount. I'm pretty sure that's right. It falls into line with the 1.2 Torr Mike was mentioning for > 140K feet (according to the SS, 1.2 Torr is actually 142185.5643).

Oh yeah, it's all based on a standard atmosphere too. Something that never happens so all the figures will be approximations when computing for pressure from altitude or vice versa.

73 -- Rick, NØKKZ

2114. Re: [GPSL] Bubble wrap survival at altitude

Yahoo group: GPSL (2002 — 2008)
Date: 2006-03-16 22:07:55 UTC
From: Joe
Topic: 2093 Message: 2114

Hi Mike,,

Ok, Like wow,, Ok, not even close,, I was thinking on this Vacuum thing,, remember the conversation a while ago about the vacuum and corona arcing of like a strobe?

That led to more thinking about vacuum,, forgive the crazy mind here,, then begun thinking of heat transfer or loss in payloads... and of course the 3 methods,, two are easy to control, but the transfer due to cooling by cold air I began to wonder how much can this cold air really cool things when it is so thin at cruising altitudes.

so i thought some more,, and thought of a thermos.. ya know a real one with the glass liner and all that..

I contacted them and asked what level of vacuum in actually in them,, and here is their reply,,

""

Dear Joe,
The minimum vacuum required is on the order of 5 x 10(-4) torr, bottles have a vacuum of 5 x 10(-6) or better after processing. 760 torr = 1 atmosphere. What happens is that the heat is transferred from molecule to molecule, which are moving about (brownian motion, the amount of movement is greater with greater temperature). More vacuum=fewer molecules. When the 5 x 10(-4) vacuum is achieved, the molecules are few enough that they don't run into each other.

You could demonstrate by using a row of students to illustrate, letting the class walls be the thermos bottle walls. A slip of paper is "heat". The students can only lean, but not step to pass the "heat". As the "vacuum" is pulled, students are removed from the line, and the rest space themselves out. When the proper "vacuum" is achieved, the students can't pass the "heat".

It always helps to have engineers available to answer this type of question.

Hope this helps.""

John Golden

now the exponent crap always bugged me,, hence the question,, but was thinking,, are we fooling ourselves with all this insulation,, if it's already in a good enough vacuum..

But from the numbers you just crunched,, i guess not,, what I did find tho is that AIR is actually an excellent insulator if you can keep it from moving around to exchange the heat energy.

I found the btu transfer at sea level density,, and at like 50% density was almost negligible., even all the way to like 1% pressure level made very little difference.. so it may seem the whole key to keeping the payload warm is to keep the air from moving at all.

Ok,, how is areogel made?

How about a payload encased in aerogel? talk about an airtight system

Joe

2115. Re: [GPSL] Bubble wrap survival at altitude

Yahoo group: GPSL (2002 — 2008)
Date: 2006-03-16 22:20:41 UTC
From: PAUL VERHAGE
Topic: 2093 Message: 2115

I find making the exterior color of the spacecraft black keeps it about 15 degrees warmer. I have an article on this on ATV Q from a few years ago. The Styrofoam airframe does a pretty good job also. An aluminum should be good because it has such a low emissivity (for what ever heat manages to get in). That's why we cover our potatoes in aluminum foil when baking them.

The interior temperature of my airframes doesn't drop below freezing until after balloon burst. The wind chill then pulls some heat out for a while.

Paul

Hi John,

I'm sure that your chamber would work great given a better pump.
Ours should leak like a seive, by all rights.

Sure took us a looooooooong time to find a pump that would hit 10 mbar -
and this one does it in spades!

From: Mike Manes
Topic: 2093 Message: 2117

Hi Hank,

Well, EOSS has had the chamber itself for at least 10 years. It was donated by one of our charter members, Andy Kellet N0???, who got from a smoke detector mfr, who reputedly was using it to test their products.

It's made from 3/8" thick acrylic or polycarbonate sheet with dadoed joints bonded and sealed with clear epoxy. The 2 smaller chambers at the bottom are sealed off from the larger upper chamber. The threaded rods suggest that the chamber was originally intended to be pressurized rather than evacuated. The lid is removable, and it's sealed to the chamber top flange using 1" x 1/4" adhesive-backed common houshold weather strip. I'm amazed that it holds the vacuum that it does so well, but once the lid is seated, the weather strip compresses nicely.

The Welch vacuum pump was acquired last summer after many years of searching from a local surplus industrial equipment distributor where one of our members works and which is owned by a cousin of one of my college fraternity brothers. Wotta find!

The lower cabinet was cut down from an old rust-bucket rack cabinet that another EOSS member donated. A few hours with a wire brush and 3 coats of Rust-O-leum got it into shape, and 4 rubber casters makes moving it about easy.

The Wallace & Tiernan 0-50 Torr absolute vacuum guage was picked up for $10 from a hamfest. A bargain until I learned that reads about 15% low. I was able to zero it in, however. The Stokes guage was another donation thru another member who retired from the metrology profession.

I must tell you that it was with great trepidation that I first applied the pump to the chamber - I had no idea whether it would withstand the external pressure. I'd heard about the damage that an imploding TV picture tube could do, and had nightmarish visions of a scene from 9/11 rushing thru my fevered brain.

So I set it up in my basement laundry room and covered it with several thick blankets. I ran long rubber tube from the chamber sample port to the guage so I could read it whilst hiding behind the door to the room, and controlled the pump via it's power cord and an extension cord. My fears abated when I read nearly full vacuum with no intervening spooky sounds. After three such runs, I dared to remove the blankets and watch the chamber from inside the room. The lid, which is just a flat sheet, did visibly deform by about 1/16", but recovered nicely.

The most recent addition was some teflon feedthrus to provide for electrical sigs in and out. They are pressed into drilled holes 0.01" undersized and appear to seal just fine.

The external digital guage uses the same Honeywell/Microswitch 142PC15A pressure transducer used in AE0SS-11, along with some passive offset and scaling circuitry to make it read either Torr or mbar on a 200 mV FS 3.5 digit DPM. Zero is adjusted referencing the Stokes guage, which tops out at 50 Torr, and scale is set using NWS radio barometer reports with an altitude correction from MSL.

Pretty handy tool. First use was to characterize some surplus anaeroid cells from surplus VIZ radiosondes. Turns out that despite their 2 in^2 area, the ends deflect only about 0.16" from mile high ambient here (610 Torr) to 1 Torr. Pretty stiff! OK for the baroswitch we use in the ATV module. I think I know how to use one to arm the load-dump-sensing release mechanism that we flew on EOSS-101, but still need a round tuit ... :=}

BTW, wanna know how a watch works? Just ask for the time ...

Hi Paul,

I have no doubt that there are many makers of bubble wrap, and that
the materials and quality may vary widely. It's good to know that
ARHAB others have good luck.

BTW, was your bubble wrap external to the payload?

From: Mike Manes
Topic: 2093 Message: 2119

Hi Rick,

Altho yer right about the standard conditions rarely applying, the
good news is that the FAA also recognizes that. This is why all
aircraft altitudes above 18,000 ft MSL, where jets fly, are stated
as Flight Level (FL), in 100's of ft. AND ... this is important,
FL is read on a normal barometric altimeter by setting the Kollsman
window, used for correcting the altimeter for local barometric pressure,
to 29.92 inHg - or standard MSL pressure. This avoids having to
continuously get the local baro reading and tweaking it into the
Kollsman during long-distance flights, which would be necessary to
ensure that two aircraft that are using different Kollsman settings
and showing that they've got 1000' vertical separation aren't
actually at the same altitude. The pilot just has to remember to
set 29.92 when climbing thru FL180.

So if a balloon is relying on a baro reading for altitude, then
there's no need to tweak for local baro pressure above 18K' for
FAA reports. It also means that the exquisitely precise-looking
GPS altitude, referenced to MSL, may not be perzactly what an
airliner at the same altitude is reading. But since our balloons
are constantly climbing or descending at least a few hundred feet
per minute, by the time the FAA sees the reading, it's wrong.

Minor point.

BTW, the order-of-magnitude per 50K' rule of thumb does work pretty
well for SWAGs.

Topic: 2093 Message: 2120

Hi Joe,

You do bring up a good point that we in ARHAB should consider:
a heat sink that works well to keep a power-hog transistor, such
as the modulator in an AM ATV xmtr, cool at sea level is not
gonna work nearly as well at 10 mbar.

Although I've never fried that part in flight, Norm Kjome tells of
some scientific payloads that have suffered from that effect.

So to be on the safe side, I rely on radiative rather than convective
heat transfer for my heat sinks. Turns out that unfinished aluminum
is a great radiator at far IR - better than the black anodize we
usually see. Radiative heat transfer varies as the 4th power of
absolute temperature difference - so if you aim your heatsink skyward
(but NOT towards the sun) it'll work great.

BTW, this poor convection at altitude also exacerbates self-heating
errors in outside air temperature measurements. This is why we
commonly see OAT readings at altitude a bit higher during 1000 fpm
ascent than during 10,000 fpm descent. The faster air does improve
convective heat transfer, just like a cooling fan on a Pentium.

>

> Dear Joe,
> The minimum vacuum required is on the order of 5 x 10(-4) torr, bottles have a vacuum of 5 x 10(-6) or better after processing. 760 torr = 1 atmosphere. What happens is that the heat is transferred from molecule to molecule, which are moving about (brownian motion, the amount of movement is greater with greater temperature). More vacuum=fewer molecules. When the 5 x 10(-4) vacuum is achieved, the molecules are few enough that they don't run into each other.
>
> You could demonstrate by using a row of students to illustrate, letting the class walls be the thermos bottle walls. A slip of paper is "heat". The students can only lean, but not step to pass the "heat". As the "vacuum" is pulled, students are removed from the line, and the rest space themselves out. When the proper "vacuum" is achieved, the students can't pass the "heat".

Mark,

That's not what you should see. It does have the track and the distance/bearing line is way out of wack.

I've attached a screen shot of a prediction I just ran.

I'm going to go out on a limb and blame it on IE vs Google.

We tested it on IE but not older versions and not on XP.

You might not what to do this but you might try downloading FireFox. It runs everything and ON everything.

I'll pass this to Keith, who works on the maps and see what he says.

Troy, KC0MIC

Mark Conner <mconner1@...> wrote: Troy,

Great job! Looking forward to using this.

I attached a screen shot of the results. Is this what I'm supposed to see? The direction/distance to landing seems a little hard to read, and I'm not seeing the red/green ascent/descent track.

On 3/16/06, Troy Campbell <kc0mic@...> wrote: All,

We've written a balloon track program in perl and published it on our web site. It's based (roughly) on the original gwBasic program by Bill Brown, WB8ELK. Rick von Glahn tells me that Balloon Track for Windows is based on the same code and it appears that the resulting course tracks are very similar.

The biggest advantage is that you don't do any cutting a pasting, etc to get weather data. It uses www.noaa.gov/ready/cment.html for it's data source and doesn't require much manual intervention. That's also the downside. You can't enter your own data. (We're working on that.) The Google Maps(tm) interface is very good (thanks to Keith Kaiser, WA0TJT) and you can download a TNC formatted file or XML file. The track file is in GPS text format, but we hope to have a an APRS formatted version this summer. We also are planning to enable uploading existing track files an plot them.

Now if I could just get a T-1, or cable or DSL in my chase vehicle.....

Anyway, you may find it useful or at least mildly amusing.

Mark,

After looking at it few more seconds, it _could_ be that your display doesn't have enough colors set. I try not to know too much about that in relationship to windows, but it sure acts like there aren't enough colors in the pallet to display everything.

From: Floyd Benjie Campbell
Topic: 2125 Message: 2125

There has been some discussion on weither to charge a fee for the Friday forums to help cover the cost of having them in the hotel conference rooms. I was given the task of doing an informal survey of some of the projected attending hams from the Denver area. The information I saw earlier this week mentioned a room rate of 79.00??? per night and that is great. I spent four months last year traveling thru out the country, staying in motels and hotels most of the trip. I stayed in over 25 different hotels and I feel 79.00 a night for a good one isn't that bad. I have checked with three of the potential visiting hams and the general consensus is we can afford to pay a fee for the Friday event. It owuld be nice to stay in the hotel and have dinner at their facility and not have to drive all over an unfamiliar town to eat at a fast food place. Let's try the central location for the event and see how we all like it. So, my vote is to have the event at the convention center/ whatever and keep everything there or nearby. It is fun to have everyone stay at the same place and visit and make now friends. We did this at the Hamcon here in Estes Park two years ago and will do it again this June. It is a great eceperience and it is time the GPSL tries the same thing. Benjie W0CBH, Mike N0MPM and Randy NQ0R.

2126. Re: Expanded polystyrene enclosures and custom styrofoam enclosures

Yahoo group: GPSL (2002 — 2008)
Date: 2006-03-17 22:23:43 UTC
From: wb8elk@aol.com
Topic: 2126 Message: 2126

The Ozonesonde styrofoam containers are great....especially for payloads that don't generate much heat and need as much insulation as possible. The bottom part has a flange the runs around the opening of the payload space....about 2 inches of foam all around the opening. The lid fits snugly on top of the flange and there is even a couple of small opening to run wires, tubing or sensors to the outside world.

A photo of container just prior to launch can be seen at:

http://www.wb8elk.com/pastflights.htm
(http://www.wb8elk.com/pastflights.htm)

I'll try to post internal views of the box this weekend.

In the two flights I've done using this container, the inside temperature has kept above 14 degrees C (57 degrees F) even during the descent stage. The payload was only an APRS system with an Alinco DJ-S11T, Garmin GPS18 LVC and an Opentracker....the two biggest heat generators were the Garmin (I had it recessed in the lid) and the 5 volt regulator on the Opentracker that also powered the GPS-18. So not much heat generated at all and it still kept quite warm.

The only problem is that this box is a very limited resource....The only way to procure one at the moment is to track down and recover an Ozonesonde....fortunately they launch them every Saturday here in Huntsville, AL but I know of only 3 other locations (most notably Boulder, CO) and Wallops Island and occasionally somewhere in CA. They transmit near 402.5 MHz (300 baud ASCII)...but drift around quite a bit so it's a real foxhunting challenge....we've found all the ones we've attached small 2m beacons onto (Squawkbox, Microhunt or KC5TRB's ORB beacon). I've found a couple the hard way by just tracking it's 402 MHz signal, but you have to be within a mile to find it usually once it hits the ground. We have permission to attach small experiments or beacons to their flights as long as they don't weigh over a pound. (We launch the UAH Balloonsats from the Ozonesonde hangar).

The box is made either for Vaisala or ECC (the manufacturers of the Ozonesonde Pump assembly)...ECC is in Boulder so maybe EOSS can make some inquiries and see where they get their box manufactured.

- Bill WB8ELK

2127. GPS Receivers

Yahoo group: GPSL (2002 — 2008)

From: Doug Loughmiller
Topic: 2126 Message: 2127

Hi Everybody,

ARBONET is preparing for our first "solo" flight in about six weeks time. I wanted to pose a question to the group as to what GPS receivers the various groups are using. I understand that we need to be careful to select a receiver that is capable of reporting altitude above 60K feet. We already have a couple of options in hand but I wanted to see what some of you have successfully flown. I appreciate your guidance.

73,

Doug Loughmiller, W5BL

ARBONET

2128. GPS receivers at 60k ft

Yahoo group: GPSL (2002 — 2008)
Date: 2006-03-17 23:49:47 UTC
From: wb8elk@aol.com
Topic: 2128 Message: 2128

Hi Doug,

I'm a big fan of the Garmin GPS-18 LVC....keep in mind it's a 5 volt unit....their PC version has a regulator built into the cigarette lighter plug and is essentially the same unit....the only thing is that I'd wrap the serial cable through a toroid or use an externally clamped ferrite shell to help against RF interference if you are using ATV. The GPS35 and the Motorola units are more impervious to RF interference...however, that being said, the GPS-18 is extremely lightweight and self contained...extremely easy to set up and only draws 60 mA...the other units draw considerably more than that.

http://www.gps4fun.com (http://www.gps4fun.com)

has good prices on these.

Also the Garmin GPS35 works fine and the Motorola M12+ but I think it's been discontinued....the VP Oncore works fine too and you can find it surplus fairly cheaply.

Ralph Wallio W0RPK has a web page devoted to what works and what doesn't.

http://showcase.netins.net/web/wallio/GPSrcvrsvs60kft.htm (http://showcase.netins.net/web/wallio/GPSrcvrsvs60kft.htm)

2129. HiBall 8 payload has been returned

Yahoo group: GPSL (2002 — 2008)
Date: 2006-03-18 00:38:35 UTC
From: wb8elk@aol.com
Topic: 2129 Message: 2129

I just got the HiBall8 payload back in the mail today with a note thanking me for the beer money (the Reward).

Everything except for the styrofoam box (former ozonesonde box) is in good shape. The box appears to have suffered more from the curiosity of the inebriated finders and the subsequent joyride through Georgia on a Saturday night than it did during the actual flight....there's a large knife gash in the side of the payload where they tried to open it up until they figured out how the lid was attached.

From: Mike Manes
Topic: 2126 Message: 2131

Hi Bill,

As you prolly know, I'm a proponent of custom-built payload enclosures using foamcore board. It's cheap, commonly available, provides adequate insulation for every payload that EOSS flies and is robust enough to survive quite a few rough landings. And since it's designed to accomodate the specific components of the payload, it's neither too large (and draggy) or too small. And fine 3D features are easy to incorporate without resorting to a milling machine or gouging out a cavity with a knife. It even accomodates captive threaded fasteners in the form of T-nuts secured with hot melt glue. I've even built in PC board slots in some payloads using 0.12" board.

I use 0.35" thick board for the external walls, reinforced and waterproofed with a coat of loud-colored Krylon. The coldest recorded internal temp was -10C, and we've never encountered a low-temp failure. If additional insulation is deemed necessary, one can use thicker foamcore or add chunks of building-grade stryofoam internally.

Steve KC0YA recently designed and built his own foamcore housing for his APRS module. He tells me that it was fun and easy --- right Steve? :=}

The piece on the subject that I presented at the EOSS-13 symposium in Denver has been updated and is downloadable from the EOSS web site.

2133. Re: [GPSL] GPS Receivers

Yahoo group: GPSL (2002 — 2008)
Date: 2006-03-18 03:14:05 UTC
From: Mike Manes
Topic: 2126 Message: 2133

Hi Doug,

EOSS has had good luck with Rockwell Jupiter receivers, reported
available off the internet for as little as $25. But be careful
to the first gen engines - they top out at 65K'. The 2nd gen
versions are speced to 40km (130K ft), and we've taken them to
over 117K' with good 3D reports.

Steve KC0YA can give you the mfr dates and firmware versions to
look for.

They run from +5Vdc at about 150mA and require an external antenna.
We use the Micropulse VIZ radiosonde flex circuit quad helix with
good results. If you use this antenna, be SURE to keep it inside
the original pill bottle! We also clip off the fragile flex circuit
stripline feeder and replace it with 3 - 6" of RG174 termniated in
an MCX coax connector for the Jupiter. Somewhat better tracking
can be acheived using a gain patch, but it's heavier, mainly
because the coax feedline must be kept full length to avoid overloading
the Jupiter front end. And it adds 50mA to the current drain.

The Garmin Etrex has also been used successfully, but it requires
a mod to power up when external power is applied. The mod is on
the EOSS web site. And it's a bit heavier than the Jupiter, but
does incorporate a patch antenna.

You might want to check:

http://showcase.netins.net/web/wallio/GPSrcvrsvs60kft.htm

Ralph Wallio, W0RPK is keeping a database of GPS receivers that pass various altitude tests. The primary barrier is 60K feet but EOSS discovered that some Jupiter boards stop reporting at 30K meters. That failed GPS receiver is mentioned. There are a fair crop of well behaved units listed.

If you are forced into using an unknown receiver and your flight attains a high max altitude I'm sure Ralph would be delighted to gather info on another receiver.

Hi Roger,

Glad it worked out for you, and that the learing curve was cheap!

Guess maybe I oughta emphasize making the bottom of the mitre cuts
shy of the bottom paper. In fact, it can be a lot shy, since the
exposed styrofoam core pretty much melts when the hot melt bead is
applied. As you noticed, keeping the bottom paper makes for a
strong and nicely rounded outside corner that's ready to fly.

I think I did point out that the width of the mitre cut on the
inside surface takes the thickness of the outer paper into account.
That allows the inside seam to close cleanly.

GL on the qual flight!

Hey Harry in Tulsa. Great pictures from the chopper during EOSS 100. Also, while visiting in florida I met an old friend of yours. Mike, WD5GLW. He even had glowing things to say about you,ha! Marcia and I met him and his wife at the Wellington FL radio club meeting while we were visiting there. I was able to make two presentations on ballooning with the EOSS group and it was a hit among the local club membership. I would hate to have to recover a balloon there Harry, there are too many snakes and alleygrabbers in the swamps down there. I don't know if there is enough breadth to Florida to allow a fast moving balloon to reach altitude before burst and descent. You would have to launch at one coast or the other to keep it within the land portion of the state, ha! Mike can be reached on the Welington IRLP node 4394. Benjie W0CBH

Ryan,

A while back I inquired about 200 gram balloons. I used private email which bounced. Then I posed the question to you on GPSL but I still haven't heard from you.

It may be that some groups are waiting to see some kind of concrete deadline for orders and/or payments. Regarding that aspect, there were one or two people that asked if it was too late to get in on the order. I don't believe you ever replied to them either.

It may seem overly formal, but I think it will work out better for everyone if a few deadlines are announced so that everyone is sure where they stand as far as being in or out of the group buy. In the long run it will be less of a hassle and less confusion for you and everyone else.

Here's a hypothetical schedule:

1. Announcement(posted to yahoogroups) of orders received so far: March 25

2. Deadline for emailed balloon orders: March 28

3. Announcement of final orders accepted: March 29

4. Announcement of payment(posted to yahoogroups) received so far: April 6

5. Deadline for receipt of payment for orders: April 9

6. Announcement of payments received and accepted: April 10

Sure... SD9 was recovered last week by George W4AVO not far from the balloon's last known position. The payload arrived here last week in decent condition - the BNC connector on the Pockettracker was the only casualty from its landing. (Haven't yet soldered it back together and tested, but I assume it will fly again!)

>Could you please mention what kind of adhesive tape you used

It was very high tech stuff - 3/4" transparent tape from Walgreen's (store brand). :)

Inquiring minds want to know, or they (I) have
forgotten. What material did you use for the envelop?

I had tried making a balloon, not a tetroon, using the
drop sheet plastic (very thin, 12x400' as I recall)
sealed with 2" packing tape but was not very
successful.

We filled it with a hair dryer for a club demo, but it
leaked badly (taping not done with care). I think
there is a photo on the web somewhere, if not I'll put
one up, if anyone is interested.

Thanks,
Don

Probably the same plastic that you used - .35 mil high-density poly. The 2" wide packing tape is serious overkill and only adds weight. Three-quarters or even 1/2" tape works fine - just be sure to apply adequate pressure (not just FORCE) to the tape. My students used spoons to smooth the tape down and apply sufficient pressure for a good seal.

Robert,

That's good news. Did you have to recruit George in a manner
similar to what happened with your New Hampshire landing, or
was George following along anyway?

The place it landed in Virginia looked to be fairly hilly.
Was there any challenge, terrain-wise, to the recovery? Any
story to tell -- like was the payload snagged high in a tree?

> It was very high tech stuff - 3/4" transparent tape from
> Walgreen's (store brand). :)

Do you have an idea of how much weight you gave up compared
to using the welded seams?

>That's good news. Did you have to recruit George ...

I found George's APRS station using Findu - he lives about seven miles from the landing site. To the best of my knowledge, he was not aware of the flight until I told him about it.

>
>The place it landed in Virginia looked to be fairly hilly.
>Was there any challenge, terrain-wise, to the recovery? Any
>story to tell -- like was the payload snagged high in a tree?
>

No problems at all - the payload was on the ground in a dry creek bed. The balloon, however, was nowhere to be found... Not surprising, really, given the 20+ mph surface winds when it landed - the payload probably snagged in the top of a tree, suspension line broke (as it was designed to do) and the balloon was blown some distance away.

>Do you have an idea of how much weight you gave up compared
>to using the welded seams?

Figure the added weight of two rolls of cheap Scotch tape - several ounces at most. And the taped seams are FAR stronger than my heat-sealed ones, at least using this very thin (and not easily sealed) film.

My only concern was that the adhesive might soften when the envelope warmed up at altitude, but this apparently did not happen (the flight profile was typical for one of my Sky Diamond designs).

Congrats Robert, that's cool. A couple questions, with
appologies if they're on a website somewhere I couldn't find.

Where did you get the plastic for the balloon? How did
you inflate it for launch? Did you use helium or just warm
air? How heavy was the payload you flew? What sort of
flight termination mechanism did you use?

Thanks in advance.

It may nearly be a wash. The taped seams could probably use the full width of the plastic. I use a 1" nominal edge allowance with my heat sealing machine (strength of my seams is as good as strength of parent material, btw), which takes a surprising amount of displacement away from the balloon.
Great to hear about the sky diamond 9 success. I'm hoping more ARHAB groups will get into plastic balloons, they enable much more interesting flights than latex. (Except perhaps for Bill Brown's mid winter latex floaters!)

To: GPSL@yahoogroups.com; KNSP@yahoogroups.com
Subject: [GPSL] Balloon payments

I have only received payments for balloons so far from:

WZ4O
CNNSP
WA0GWA

A few more have asked about money orders so I assume the money is coming that way. Some groups have yet to be heard from.

Date: 2006-03-22 10:55:09 UTC
From: wb8elk@aol.com
Topic: 2155 Message: 2155

I'm in the process of totally revamping the website....I now have flight data and photos from the most recent HiBall-8 zero pressure flight as well as HiBall-7....I'll be shortly adding flight data and photos from all 2005 flights and working backwards from there...it'll take me awhile to get all the way back to 1987 however, but that is the goal. I'll be adding links for circuits and payload designs too.

The HiBall-8 payload was mailed back to me last week from Georgia and is in good shape, except for the hunting knife slash in the styrofoam.

>flight termination mechanism did you use?

The plastic was exactly as I demonstrated at GPSL 2005 - .35 mil painter's plastic from Home Depot.

We usually inflate Sky Diamonds with ambient air and let them warm in the sun until they lift off (usually 5-10 minutes at most). In this case, we had gusts to 10 mph off the lake and were launching from a soccer field surrounded by tall trees, so we augmented with some helium. By the time the tetroon was at an altitude of 2500 feet, it had fully inflated with air and thus the flight was almost entirely solar.

Payload was about 2.5 pounds and consisted of a mil-surp LiSO2 battery (15v, 8.5Ah), Geko GPS with power adapter, and Pockettracker - all in a styro beer cooler wrapped in black polyethylene.

Flight termination was the result of the setting sun...

All,

We've added an online Ascent Rate Calculator to our website. You can link to it if you wish. It's based on Bill Brown's gwBasic code from 1993, rewritten in perl. (cube roots turned out to be not as hard as I thought in perl.)

> We've added an online Ascent Rate Calculator to our website.

Troy,

I just looked at the calculator. Those ascent speeds are
just rough estimates, so I have a suggestion for a small
tweak that gives the right connotation to users of your
calculator and is also good engineering practice.

Take the ascent speed and knock off at least those two
extraneous decimal points. The presence of the digits after
the decimal point implies *way* more precision than exists.

I'd further round off to the closest 10 ft/minute to fit
even better the reality of the imprecision of the estimated
speed.

Hi Hank,

I find your LiftWin 041 on my desktop to be a lot handier than
any online calculator. And it yields plenty good predictions
for ARHAB purposes. Thanks, Hank!

And you're right about the complexity of calculating ascent rate.
I worked with a very bright aerospace engineer, working down to
the bare metal to see what's behind the oft-observed near-constant
ascent rate for latex balloons. We were deep in to Reynolds and
Grashof numbers and finally decided that the only way that this
phenomenon can be explained is to allow the shape of the balloon
to deviate from a sphere over the ascent course. This effect is
far more pronounced with plastic balloons, BTW, which look more like
mushrooms or inverted teardrops during early ascent.

Mike,

Hank did a great job on Liftwin but I'm a Linux kinda guy so LiftWin is a non starter for me. If I absolutely _have_ to use winbdoze applications, I run them under a program called 'Crossover Office' Most windows programs run fine under it but Liftwin won't. So I rewrote Bill's program in perl. I have been using the command line version of that program on my desktop for a while. I'm missing out on a lot of other functionality of Liftwin, but what I'm using is all I really need.

Since we've been doing more outreach and training in the ARHAB arena, we've started putting HTML front-ends on some of the software we use so that the application can be ubiquitous. Anyone can get at it without having to download and install anything and it doesn't care about linux vs windows vs mac-X.

One of these days, if anybody expresses an interest, I'll put the source code in the download section of the web site

In the meantime, the online version can be used to let everyone in on the planning..... if they want to. The really great thing is, if something else works better for you, use that. If you like the on-line version, use that. Whatever works in your situation. We just thought it would be nice to contribute to the community.

In the field on launch morning and during recovery, I use Xastir, gpsd, and several perl programs, including the ascent rate calculator. (I'm anxiously waiting for DSL via wireless for $9.95 per month, available anywhere we chase balloons.)

Hank:
Thanks for the suggestions for tweaking the presentation in the user interface. I implemented those yesterday. I also fixed an error condition that occured if you manage to enter more payload weight than nozzle lift.

>under it but Liftwin won't.

Troy,

This is the first time I've heard of this way of trying to run
LW. Just read a little of the Crossover Office website,
and while in actuality many programs may run well under it,
it seems like there sometimes has to be some kind of programming
work done (by Crossover) for a target software, case by case,
basis:

Q. Are there any Windows applications that you can't get
working under CrossOver?

A. Our experience suggests that the answer to this is most
likely "probably not". For all practical purposes, we think
we can make anything run under CrossOver. After all, if we
can make MS Office run, odds are pretty good that we can get
your application running, too. The only question is how much
work is entailed.

LW does not do anything fancy or unorthodox, but it was
compiled under a now old WIN 3.1 compiler, so that may be part
of the answer.

Just out of curiosity does Balloon Track run for you under
CrossOver?

I'd like to ask you a few more quesions which I'll do in email.

2167. On-line ballooning tools

Yahoo group: GPSL (2002 — 2008)
Date: 2006-03-24 21:12:29 UTC
From: mconner1@gmail.com
Topic: 2167 Message: 2167

Another concept to consider - many of us work on systems with tight restrictions on installing new software. Having on-line tools like the ascent rate calculator and balloon track prediction is a great help in this situation. Now I don't have to shuffle data files and fire up my old POS standalone laptop to run a track prediction at work.

Unfortunately it can be almost as difficult to provide on-line tools supported by a wide range of browers as it is to provide installable tools for the wide range of operating systems.

My hat's off to Troy and his gang for bringing these tools to an on-line form.

Hank,

There's a pretty big list of 'testing working applications' on their website and the Crossover software manager recognizes all of it, knows all the pecularities and installs/runs it without a peep. Even simulates a reboot when when its done. The latest version let's you put apps in 'bottles' and each bottle can emulate win98, win2000 or win2003. All the MS-Office products run better on Crossover (for me) than Windows. But I think that is mostly because the underlying O/S is more stable (shameless Linux plug). Plus, when something DOES hang, it doesn't take down the whole computer, just the Crossover instance.

For what it does, Crossover is pretty slick. However it won't do everything. What it does do, it does amazingly well.

I did get Balloon Track for Windows to run on an earlier version of Crossover but haven't had any luck with it in the latest release. It works in the win98 bottle. Since I wrote a PerlTrak, all my efforts have been spent on refining it and interfacing it to Xastir .

I agree about the compiler. I'm pretty sure that the issue with LW is the version of VBRUN. I say that because my software guys have to download something from MS to make LW run on XP. (Wow! look at all those letters!)

Anyway, this discussion is barely on-topic so you can email me directly.

Cheers,

Troy

2169. Maybe a little OT: running windows balloon software under Linux

Yahoo group: GPSL (2002 — 2008)
Date: 2006-03-24 22:23:22 UTC
From: Hank
Topic: 2157 Message: 2169

> There's a pretty big list of 'testing working applications' on
> their website and the Crossover software manager recognizes all of
> it, knows all the pecularities and installs/runs it without a peep.

Troy,

The point I'm trying to explore and bring out is that it may
not be totally fair or accurate to simply say that this Crossover
software runs most windows software but not software A or B
(thus allowing for the inference to be made that A or B was an
unusual exception).

I saw the list, and it naturally comprises the more popular
stuff that is **commercial**. What I'd like to know with some
higher degree of certainty is how much random **shareware**
software runs under Crossover where there has been no special
effort made by any party to take particular steps to make it
run. There are many sections of the Crossover site that get
into issues about how to get a certain type of software X to
work under Crossover (which presently doesn't), including
the idea of potential users raising money to enable Crossfire
to do the programming work on Crossover to make software X work!

I'm not speaking as a Windows evangelist, because I'm not.

So, to summarize, the question for me is not how many commercial
programs are listed as working, but how many windows programs
in the universe work under Crossover naturally without any
special effort and attention by Crossover programmers.

> Anyway, this discussion is barely on-topic so you can email
> me directly.

It may be a judgement call at this point about OT. There might be
someone on list to whom this discussion might be valuable in
some oblique way.

What I'll ask in email is very specific to your experience.

Hank

Hank,

>> There's a pretty big list of 'testing working applications' on
>> their website and the Crossover software manager recognizes all of
>> it, knows all the pecularities and installs/runs it without a peep.

> The point I'm trying to explore and bring out is that it may
> not be totally fair or accurate to simply say that this Crossover
> software runs most windows software but not software A or B
> (thus allowing for the inference to be made that A or B was an
> unusual exception).

I wasn't trying to make any inference one way or another about any software. Just like I pointed out earlier, I just plain don't care what people use. I was only reporting that the list of software that Crossover reports to run, DOES run and very well. So I'm pretty sure that the paragraph is accurate. Anyone inferring anything other than me saying "the programs listed on Crossover's web site as being tested, do work" simply isn't reading the the paragraph. Fair doesn't enter into it. I'm not making judgements, just reporting experiences.

Some 'unsupported' [unsupported by Crossover, that is] does run. Some doesn't. Again, value judgements like 'fair' doesn't enter into it.

I only state that "I use Linux and if I have to run Windows software I try to run it under Crossover. But I can't make everything run under Crossover. LW was one of those items that I can't get to run." End of statement. No judgement, no 'fair or unfair'. You could probably make the judgement that I am too incompetent to get it to run if you want. Heck, it might even be true. [I've been told that I'm trainable though.]

If it's useful to anyone, my experience with unsupported software (unsupported by Crossover, that is) includes:

The configuration utility for the TINY TRAKER III. It is unsupported, doesn't have an installer, but runs fine under Crossover. [I really didn't expect it to work either because of the serial port, but it just worked.]

Balloon Track for Windows has worked on older versions of Crossover I have tried, but some things didn't display (the real time data window and some of the graphs). Not Balloon Track's fault, and I didn't expect it to work at all.

MMSSTV is a Slow Scan Television transmit/recieve program that I didn't expect to work. Heck, it uses the sound card, graphics card and the serial ports. It couldn't possibly work could it? But it worked fine when I tested it. (However, I use QSSTV, an SSTV program for Linux)

There are several 'little' programs that I fully expected to work, but don't. A couple of label making programs, some programs that turned out to be 'compiled' batch jobs for MS-Access, etc.

I was expecting LW to work because balloon track worked. I'm still betting that if LW were compiled on a newer O/S (at least win98 or newer) it would probably work. LW just doesn't do anything exotic by computer standards. BUT, I don't KNOW that, I'm just guessing.

As a general observation and is ONLY BASED ON MY EXPERIENCE, NO WARRANTY, EXPRESSED OR IMPLIED, if the program was written in C or C++ or C#, it appears that it usually works. If it was written in VB, it may work, but ususally I can't get it run without help. And sometime, I can't get it to work at all. A qualifier to that is that programs that have installers usually seem to work no matter what it was compiled with. AGAIN THIS HAS BEEN MY EXPERIENCE, AND I'M ONLY REPORTING IT. THIS IS NOT AN OBJECTIVE EVAULTION, FORMAL STUDY OR REPORT. JUST A STATEMENT OF "THAT'S WHAT IT LOOKS LIKE TO ME".

Crossover and Wine, to me both fall under the header of the tap dancing elephant. The amazing thing is that the elephant DANCES. When I find out that the elephant can't do the polka, I don't get too upset about it. I just won't book him at any parties that require polka dancing elephants.

> I'm not speaking as a Windows evangelist, because I'm not.

It may sound like I'm a linux evangelist, but it's more 'I don't like Bill Gates'. To be honest, I've been programming or administrating Unix and now Linux systems since 1976 and DOS systems since 1981 and Windows systems since 1994. So I've had more experience with *nix system.s My dad once quipped, "If the only tool you have is a hammer, every problem looks like a nail." My personal toolbox has a big 'L' on it. Other, equally or better skilled people's toolboxes have a big 'W' on it.

If a piece of Windows software is so important to me that I can't live without it, and it won't run under Crossover or Wine, I'd run a virtual machine under Linux with Windows on it or dual boot. Or write something that will work in my environment.

If it's REALLY REALLY important that I run a specific Windows application, I'll buy a Windows box and run it. Which is what I recommend to everybody. I the application you really want or need runs on Windows, buy Windows. The author won't support it otherwise, and with good reason.***

This is getting way to long winded. I guess I'll shut up now.

Troy

*** Web-Based Ajaxian type applications will be breaking this model soon, in my opinion.

Hank <n1ltv@...> wrote:

Troy,

The point I'm trying to explore and bring out is that it may
not be totally fair or accurate to simply say that this Crossover
software runs most windows software but not software A or B
(thus allowing for the inference to be made that A or B was an
unusual exception).

I saw the list, and it naturally comprises the more popular
stuff that is **commercial**. What I'd like to know with some
higher degree of certainty is how much random **shareware**
software runs under Crossover where there has been no special
effort made by any party to take particular steps to make it
run. There are many sections of the Crossover site that get
into issues about how to get a certain type of software X to
work under Crossover (which presently doesn't), including
the idea of potential users raising money to enable Crossfire
to do the programming work on Crossover to make software X work!

So, to summarize, the question for me is not how many commercial
programs are listed as working, but how many windows programs
in the universe work under Crossover naturally without any
special effort and attention by Crossover programmers.

> Anyway, this discussion is barely on-topic so you can email
> me directly.

It may be a judgement call at this point about OT. There might be
someone on list to whom this discussion might be valuable in
some oblique way.

What I'll ask in email is very specific to your experience.

Hank

This is awesome

http://nearspaceventures.com/w3Baltrak/readyget.pl

Ok, wondering if we can add one more thing to it?

With all these "Floaters" being put up recently,, can we add a "Float"
altitude and duration part to this?

From: Mike Manes
Topic: 2157 Message: 2172

Hi Troy,

Sypatico re Windoze ... I'd hold my breath every time it boot, if I still had that much lung capacity ... USoft's finest product was MSDOS 3.4 ... been a bug-ridden slippery slope since. However ...

My consulting business as well as a whole bunch of non-business comms rely on uSoft apps, e.g. Office, etc. And I've seen how "compatible" the Office clone products run on the XYL's OS-X machine. So I just grit teeth and avoid OS upgrades (beyond the so-called "Service Pack" bug fixes). In my defense, tho, I use Mozilla for i'net apps.

I do have a HD with Red Hat loaded for my laptop, and have toyed some with it, with a LOT of help from #3 son. By 'n by, that Round Tuit will show up and I'll take the leap. But in the meantime, I guess I'll still be counted amongst the lemmings.

Not sure you noticed, but Liftwin requires the uSoft Visual Basic runtime package, vbrun, to be installed. Maybe that's been ported over to Linux by now?

Note also that Hank also did a lot of tweaking with Bill Brown's algorithms to force 'em to match the balloon mfrs' empirical ascent curves. And those of us who've flow the same make & model balloons with nearly equal payloads have learned that ascent rate and even burst altitude can only be estimated to +/- 10% at best. When one considers how latex balloons are made, the observed unit-to-unit variations shouldn't come as a surprise.

And no one has discovered why low ascent rate latex balloons have a far greater tendency to stall than do fast ones, although a negative inflection is ascent rate is often observed even with fat fills. I suspect it may have something to do with a rather broad spread in Reynolds Number from the deck to 10 mbar; but I'm dead wrong a lot, too.

There's nothing wrong with getting the ascent rate code out where more folks can get to it. It would be nice, tho, if more of the really effective apps like WinBallTrak could be ported over to Linux etc.

Oh, and when you find that cheap DSL service, don't keep it under yer hat! I still pay twice that for 56K dialup!

Keep up the good work, Troy.

Mike,

I guess that it just has to remain a mystery with a plausible
but not rock solid explanation if you guys didn't solve it.

Also my derivation that had the balloon either speeding up
or slowing down with increasing height (guessing it was the
former) was okay as far as it went, making the usual
assumptions. It's just that the basic model is missing
something, like the variable shape factor you mention.

It still amazes me that the ascent speed seems to adhere as
well as it does to a constant. There are a good number of
anomalous amateur flight logs, but I believe the vast majority
are really pretty steady from liftoff until burst.

Hi Hank,

Well, like so much other technology that's been once well-understood
and slowly forgotten (like the MIT Series), I'd be not surprised if
somewhere lurking out there is a paper which precisely describes
latex balloon ascent behavior.

Sounds like a great topic for an aero engineer's master's thesis!

Any takers?

Mike,

As a far as I know, it does.

vbrun300.dll

Using WIN98, as soon as the above file was removed, LIFTWIN
wouldn't work and reported that it couldn't find the file,
which it named.

I'm going to check what happens on WIN2000.

I guess it's because at least these early VBasics compiled
to an intermediate code, not machine language.

Hi Hank,

LiftWin 041 runs fine on my Win2K machine, and I suspect that
vbrun300.dll got installed with the OS, since I didn't have to
xfer it when I ported LiftWin over from W98. It's still the
5/93 version and is located in C:\WINNT\system\.

Just a final notice / request for articles.

It is about time to start putting together the Spring issue of Amateur Television Quarterly. I will need articles by April 1st. Please email me and let me know what will be on the way.

The Spring issue will have information about ATV get togethers and meetings at the Dayton Hamvention. We will be in booth 207 with lots of ATV stuff to show and tell and sell! Hope to see you there.

Thanks.

I will put a short blurb together about GPSL 2006 in Hutchinson.
Probably just a paragraph or two.

The hotel should be sending me a contract to sign in the next day or so,
and then things will be finalized.

Zack

Hi Paul,

Yeah, just doing the W = D = Cd x Ae x v^2 x d doesn't result in constant ascent rate, even letting Ae rise as 2/3 root of d. That's what prompted us to dig deeper into the fluid dynamics - and STILL couldn't get a constant w/o tweaking Cd as a function of altitude.

Master's thesis, anyone?

Hi Ralph,

Well, yes, there are vertical components to air currents. This
was pointed out to us with abundant clarity by Dr. Cec Girz of NOAA:

"Who sez the wind only blows horizontally?"

But those vertical currents or votexes are rather limited in size
and don't affect the flight over more than about 10,000 ft of ascent.
And they appear strongest near the tropopause and on the edges of
the jet stream.

Ok, then what causes the extreme variability in ascent rate during most flights and months(?) Note
that in the June01 graphic that there were three simultaneous flights. Two flights have similar
ascent rate variations. The third is very different. Perhaps -average- ascent rate is a hint. The
two similar flights averaged ~1,000ft/min. The third averaged ~500ft/min. --w0rpk

> Clint Serman, a friend of mine who's a soon-to-be ham, and I left Knoxville about 5:45 this morning for Erwin, TN. Clint was there on the day of the launch and he's been interested ever since then in going back and recovering the payload. Timing has just not worked out until today. I must admit that he was rather excited on the days that others attempted the recovery and were unsuccessful, simply because he really wanted to go get it.
>
> He and I researched many, many methods in getting it down. We talked to friends who were engineers who all came up with great solutions. Some were impractical, while others seemed doable. The method we ended up choosing came to me last Friday afternoon. While browsing www.howstuffworks.com, (a great site I might add), I happened upon "How a Spud Gun Works". It had been years since I saw one and fired one so I decided to read. After reading the article, the though occurred that this just might be the solution. Less violent than a gun but has enough power to knock it down in a single shot. We went to Lowe's that night to buy the materials.
>
> Needless to say, I was amazed at the power of such a device with a medium sized potato, 5 seconds of hairspray and a spark. We practiced for hours at an undisclosed location :-) to perfect our aiming amp; firing skills. This past Thursday, we were satisfied enough with the results that we felt good about taking it up the mountain.
>
> We hiked in from the Hilemon property. I had all of the coordinates marked in the GPS for the directions we needed to go to pass around the west side of Devil's Looking Glass and then up to the ridge line. Well, between low GPS signal in the trees and a rather cheap compass as a backup, we ended up heading due north and found ourselves really, really struggling to make the climb. Hindsight being 20/20, this was simply because we were scaling the side of Devil's Looking Glass and not going around it. Well, it was too late to turn back now and backtrack, so we kept the course. Quite simply, it was grueling. We climbed to the very top only to realize that we had to climb all of the way back down on the other side in order to get over to another ridge. The journey down the mountain, although a bit quicker, was no less treacherous. It's safe to say that no human has been in some of those places in years at best. We heard amp; saw our share of snakes on that journe!
y!
>
> Finally, at 11:35, just three hours after locking the car doors amp; heading up the mountain, we arrived at the payload. We unpacked our bags, setup our gear amp; started the

camera rolling. We had a couple of test fires with the potato gun just in case something wasn't working properly. Shot #1 and #2 were unsuccessful in hitting the payload. Shot #3 struck the bottom right corner of the payload but only put a small crack in the box. We decided to give it just a bit more hairspray, naturally :-) With the camera rolling and on a tight shot of the container, we fired shot #4 and it was a winner. The potato entered the bottom just slightly right of the middle and proceeded up and out the top. The force of the potato passing through took the container up with it, which we believe is what caused the plastic handles to break.
>
> The styrofoam container fell the ground and rolled about 35 feet down the side of the hill where it came to rest against a tree. I ran up, grabbed the camera that was still rolling and we went down to inspect the contents. Fortunately, nothing fell out of the box on the roll down the hill and even better than that, everything was intact and nothing was broken. We inspected the contents, packed them up as quickly as possible and headed back to our bags to start packing them.
>
> We decided we would take the path of the river back to the Hilemon property. Makes me wish we had done that to start with. We left the payload area at 1:15 and were at the car at 2:10. After saying good bye to the Hilemon's we were on the road at 2:30. We came back to the shack to deliver the contents, took a few pictures, and then headed home.
>
> All in all, it was a fun day, an incredible workout, and a great introduction to a really neat facet of ham radio for a future ham. And oh yeah, for those that watch the video, we were tongue-in-cheek the entire day about getting this payload down. Please - no one misconstrue our certainty in getting the payload container as an attempt to belittle anyone else's previous attempts. Had others not tried the methods they did previously, I would have been up there today trying those same things. I was just fortunate to learn from their trials on what to do and not to do. As always, this is a collaborative effort and it takes all of us to either design the thing, inflate the thing, launch the thing, track the thing or recover the thing. I'm glad I got to be a part of this mission. So, until next weekend, this spud's for you!

Since air density drops with increasing altitude, the indicated air speed of the balloon decreases. That may influence Cd. I guess it's time to figure what goes into determining Cd.

This was just a proposal from about a year ago I doubt very much a high def version of it exists... sorry about that. To my knowledge there is no official logo for ARHAB just the verious clubs with their own versions, this could very well be as close as it will come. But I bet if you wanted to design one and make it available for us that would work too.

Good luck.

Zack,

I can recreate a clone of that image given just a little time to learn how to drive Corel Draw software I just picked up a few days ago.

That will yield a vector graphic representation which means a bit mapped image can be generated to any dpi resolution needed.

It will be good practice anyway. I do know how to draw a nice, smooth curved line now, but that's about it.

I'll try to have something by Monday evening.

If anyone else has either Corel or Adobe Illustrator and is more adept, please have at it.

Hank

Hi Ralph,

Took some time to study your web page on ascent rate data from 2001 and 2002.

I looked for flights that launched nearly simultaneously from the same site. EOSS-49 and -50 both launched in Apr 01, but exhibited very different ascent rates, especially below 25K'. The reason is most likely due to differences in balloon configurations:

EOSS-49 used a 1200 gm latex to carry up about 11 lb of Colo SGC and EOSS payloads - fairly common configuration. However, I suspect that there may have been a leak in the balloon that cut the ascent rate from an initial 1200 fpm to less than 700 fpm above 35K'. I rather doubt that there was a 500 fpm downdraft over Windsor from 35k' on up to 88K', or a 500 fpm updraft from sfc to 25K'. However, a slight negative inflection in ascent rate somewhere around the tropopause isn't all that uncommon.

EOSS-50 was an experiment for Pioneer Astronautics, where the main lift balloon was a 3000 gm latex, and attached below were three underfilled 600 gm latex "drag balloons". It launched 1 hour after EOSS-49. As I recall, the drag balloons burst well before the 3000 gm let go at 104K'.

What's wierd is that one wouldn't have expected EOSS-49 to be the one to have exhibited the anomolous ascent profile.

Referring to the 30 Jun 01 data, the NSTAR and NSBG profiles look pretty similar, except that the NSBG data shows a lot more spread than NSTAR. This might be attributable to GPS altitude report errors, which also are not that uncommon, and are worse where GPS signal quality is impaired; this is a factor which probably deserves some attention.

Now, the TVNSP bird appears underfilled from the git-go. But all 3 do show similar singularities in ascent rate at about 40K' (June tropopause?).

I guess the real question that started this thread is why we don't observe a generally exponential ascent rate curve over altitude that a constant Cd would predict, rather than the more common constant+/-20% or so that we so often observe.

Since 2001, EOSS has been flying quite a few "two-fers" for Colo SGC, launching about 45 minutes apart and using identical 3000 gm balloons and nearly equal neck loads. It might be instructive to include

those data in this study as well. Now, note that we have tweaked
with % excess lift between pairs of two-fers from time to time, but
those show up right away in the initial ascent rate. Another variable
is surface wind during fill; 45 minutes can make a world of difference
over even that short time span.

Until there's more study of what factors affect balloon ascent rate,
other than GPS errors and vertical air currents, then I guess we're
stuck with SWAGging a near-constant rate pre-launch, and keeping
track during the flight to know what's really going on.

I have the raw data from dozens of Ozonesonde flights taken a week apart....the Vaisala pressure sensor used is more consistent than what you'd see for GPS altitude and seem to correspond closely with GPS readings from two calibration flights I flew with them last year....In the first flight we saw a deviation between the sensor and the GPS altitude above 90,000 feet but up to that point the pressure altitude corresponds very closely to the averaged GPS readings....the second flight was dead on up to 92,000 feet and then we lost the GPS above that. I'm looking forward to doing one more GPS calibration file and see how things work above 90k.

The neat thing with these flights is that the pressure altitude readings are in 1 second increments and won't show the GPS altitude variances normally seen with GPS data.

I'll try to plot a few of them when I return from Ohio to see how they compare....they are filled to almost the same precise lift, same balloons and flight train configuration (except for the flights where I hitchhike with them).

Paul,

That's a much higher resolution version of what was previously
uploaded.

It should be plenty good for magazine reproduction.

For the record, the clone is coming along -- about 2/3 done.
These fancy graphics programs are tough with respect to the
steepness of their LCs.

Hi Bill,

Hey, do you have specs and a source for the Vaisala baro sensor?
We could use a few more really good ones for payloads and the
altitude chamber. Our single Honeywell/Microswitch sensor gets
swapped between a payload and the chamber between flights.

2204. Re: [GPSL] The mystery of the near constant ascent speed

Yahoo group: GPSL (2002 — 2008)
Date: 2006-04-04 13:28:46 UTC
From: PAUL VERHAGE
Topic: 2157 Message: 2204

I had an idea last night.

I'd like to develop a barometric climb indicator. Is there a simple way to sample the voltage from a pressure sensor and hold it in a memory for one minute? I'd like to compare the pressure reading from one minute ago with a current pressure reading. The two voltages are the inputs to a comparator. If the pressure has dropped between the two measurements, then the comparator outputs +5V, but if the pressure had increased, then the comparator outputs a 0V. By monitoring the output of the comparator your flight computer can determine if the balloon has burst without a GPS.

Paul

>>> manes@... 4/3/2006 10:04 pm >>>
Hi Bill,

Hey, do you have specs and a source for the Vaisala baro sensor?
We could use a few more really good ones for payloads and the
altitude chamber. Our single Honeywell/Microswitch sensor gets
swapped between a payload and the chamber between flights.

Paul,

I'm not sure if it would be possible to do both "simple" AND reliable (under the very low temperatures that might be encountered) using linear circuit techniques.

However, with reduced pin and part count microcontrollers, this would be pretty easy to do with one or two extra op amp packages for the weak pressure sensor (for the more conventional current or voltage output pressure sensor, not the cap type that Vaisala favors) signal.

Using a micro would also allow a simple algorithm that would be hard to fool into calling for a cutdown due to momentary glitches.

Hank

Hi All...
Been quietly watching this YahooGroup for a number of years now.
Yesterday I saw an interesting device that might be good for some "air time",
and thought I would post it here..

It only records in 640x480, but with a 1-2GB SD card you could probably get
several hours of flight video.. They do caution about battery power at low temps though...

http://www2.oregonscientific.com/shop/product.asp?cid=6&scid=14&pid=560

After checking the link, click on the 'mini-website' link to see some video.

Looks like a smaller form factor than the Aiptek 4-in-1/5-in-1
cameras, but around the same price (this one is $120, might be cheaper
elsewhere). HABITAT has had good success with their Aiptek camera.

Video quality is not quite as good as a VHS-C/Hi-8/DV camera, but it's
quite a bit less weight and volume and with a large card a longer
record time.

Cool. Here's another chip video camera for only slightly cheaper:

http://www.bhphotovideo.com/bnh/controller/home?O=productlist&A=details&Q=&sku=332786&is=REG&addedTroughType=categoryNavigation

Same resolution, possibly less robust, very light-weight (looks like
most of the internals of a videocamera cell phone without the phone).
Records 2 hours of video with a 512MB SD card.

2210. Re: [GPSL] The mystery of the near constant ascent speed

Yahoo group: GPSL (2002 — 2008)
Date: 2006-04-06 02:08:20 UTC
From: Mike Manes
Topic: 2157 Message: 2210

Hi Paul,

Here's another unabashedly non-high-tech way to get a barometric pressure rate-of-change indication:

Use a very sensitive DIFFERENTIAL pressure transducer, e.g. inches of water full scale. Vent one port directly to ambient, and bond the other port to a fixed volume which also has a very small orifice vented to ambient. The fixed volume serves as the "memory" of earlier pressure, so to speak. If ascent rate is fast, the pressure in the volume will be greater than ambient, since the orifice flow must be greater.

The volume could be made from a ping-pong ball. Differential sensors are also a lot less expensive than absolute sensors, and in this service, they needn't be nearly as a accurate and stable as an absolute sensor.

Now, I suspect that the "gain" of this scheme will vary quite a bit with altitude, however. But I have a feeling that it's the same method used in aircraft vertical speed indicators and in hot air balloon wotchamacallits. Those instruments may have a means to adjust orifice size as a function of altitude.

This is an idea that's been floating around in my head for a few years, as yet awaiting that coveted "round tuit". But if this interests you, go fer it! Be interested in seeing what you learn from it.

2211. Taylor Launch

Yahoo group: GPSL (2002 — 2008)
Date: 2006-04-06 12:41:36 UTC
From: Holmes, Will
Topic: 2211 Message: 2211

Within the hour Taylor University will launch our BalloonSat 25 (or at least some number close to 25). This launch is in cooporation with Taylor's advanced electronics class. The main experiment of the day is testing a wireless zigbee network between pods on the balloon. The different pods will communicate with each other through zigbee (a wireless network protocol that uses the 2.4 GHz band). The data from the pods will be collected by the command pod and transmitted to our ground station through a 900 MHz modem.

The data collected by the pods have to do with UV and ozone detection.

You can track the BalloonSat using KB9ZNZ

2214. CALLING ALL PRESENTERS

Yahoo group: GPSL (2002 — 2008)
Date: 2006-04-11 00:58:16 UTC
From: Zack Clobes
Topic: 2214 Message: 2214

I'm now taking volunteers and requests for sessions at the 2006 GPSL in Hutchinson. If you are interested in presenting, please include the following in your response:

Topic (5 words or less)

Short description of your presentation (2 sentences or more)

How much time do you expect the presentation and related questions to take?

Do you have a preference of when you present?

What resources will you need for your program (projector, computer, DVD, tables, spinning rooms, etc)?

If you are not interested in presenting, but would like to see someone else speak on a specific topic, I'd be interested in hearing your suggestions.

Zack Clobes, W0ZC
Project: Traveler

2215. Re: [GPSL] CALLING ALL PRESENTERS

Yahoo group: GPSL (2002 — 2008)
Date: 2006-04-11 02:04:36 UTC
From: Troy Campbell
Topic: 2214 Message: 2215

Zack:

Topic:
OnLine Flight Prediction Service

Description:
Demonstrate the work flow for interfacing the perl based balloon track software with www.arl.noaa.gov/cmet.html.

Demonstrate the interfacing of the resulting computed track files to google maps V-2

Demonstrate the source code and usage of the on-line ascent calculation.

Demonstrat the open-source graphing software and interface for the graphs used in the on-line balloon tracking system (currently only one graph but working on some more)

Present some ideas for expansion of the system. Q&A

Length:
The actual presentation shouldn't take more that 15-20 minutes. If the questions aren't to involved, that should be all.

Schedule:
Don't have a preference on presentation time.

Requirements
Spinning rooms are optional. Mostly will need a projector, computer with a reasonable browser on it. and internet connectivity. Worst comes to worst and I can bring a projector and computer, I'll just need an internet connection (faster than a dialup or google maps will crawl).

I just found out a lot of my email is blocked by Group Wise as spam.
for some reason, stuff from GPSL is often blocked. I can now see the
blocked email, so I shouldn't miss any more messages. If someone
emailed me and I didn't reply, please contact me.

I'll present on BalloonSats in high school. I'm getting ready to write
about them again and will have some products I'm developing. So my
topic is, BalloonSats in High School. I'll talk about some new
construction techniques and experiments. I won't need more than 30
minutes (I think that's typical for us). I don't care when I present
and I'll need a LCD projector.

Thanks for hosting GPSL this year.

Paul

>>> zclobes@... 4/10/2006 6:58 pm >>>
I'm now taking volunteers and requests for sessions at the 2006 GPSL in

Hutchinson. If you are interested in presenting, please include the
following in your response:

Topic (5 words or less)

Short description of your presentation (2 sentences or more)

How much time do you expect the presentation and related questions to
take?

Do you have a preference of when you present?

What resources will you need for your program (projector, computer,
DVD,
tables, spinning rooms, etc)?

If you are not interested in presenting, but would like to see someone

else speak on a specific topic, I'd be interested in hearing your
suggestions.

2218. Re: [GPSL] CALLING ALL PRESENTERS

Yahoo group: GPSL (2002 — 2008)
Date: 2006-04-12 14:48:23 UTC
From: mconner1@gmail.com
Topic: 2214 Message: 2218

Topic: Meteorological aspects of high-altitude ballooning

Description: Basic meteorological factors affecting high altitude balloon launches and track predictions. Understanding meteorological charts and models. Forecasting tips.

Time: 45-60 min (includes Q&A)

Resources: Computer with projector and PowerPoint

For those of you at GPSL 2002 at KSU, this talk will be an update of the one given there.

From: Mike Manes
Topic: 2214 Message: 2220

Hi Zack,

I'd like to show the group a little widget that appears to avoid
one suspected cause of PBC:

Topic:
"Fast Burst-sensing Balloon Release"

Abstract:
Shards from a burst latex balloon remaining attached to the apex of
the parachute is a suspected major culprit leading to Post Burst
Chaos (PBC), since it can exacerbate parachute instability, especially
above about 50,000 ft. Separating the balloon lift line immediately
upon burst should eliminate thus undesired effect. EOSS has developed
and successfully test-flown such a device, which, once armed, will
release the balloon lift line immediately after the line tension drops
below a predetermined trip point. ATV imagery shows a successful
release and no signs of PBC and will be shown as a wmv movie. Other
PBC-avoidance schemes will also be discussed, along with maybe some
spooky pix of PBC consequences.

Time: 15-20 minutes + Q&A.

A/V: SVGA projector. Hold the spinning room :-{.

2nd topic:

One of our newer members, Steve Meer K0SCC, is working on a wireless
"Balloon LAN" to permit inter-payload communications up and down the
flight string while avoiding the seemingly inevitable risk of cable
damage due to line twisting. We've test-flown it with mixed success.
But we hope it'll be proven in time for GPSL, and that Steve will
have a presentation ready to go. If so, I'll let Steve respond
with your requested info, or a "No way, Jose'" - whichever.

Hello all,

This online store is selling the early version of Precision Mapping V5.0 for $8.95 and it works great. It will, with the disk in go to street level and the detail shows sections. I think this would be great for spotting with the software detail. I bought it and it beats Street Atlas hands down..IMHO

Hey, that's great, Steve!

I'm sure the GPSL audience will take a lot of interest in the B-LAN;
there's been chatter about such a thing for a couple of years now.

The past GPSL conference sessions have been pretty informal in view
of the "visiting firemen" nature of the audience. Kinda like
some of the presentations at EOSS meetings. Last year, the audience
was about 50 or 60 as I guesstimate, and included some
professional educators from Space Grant colleges just getting into
this business. This is quite an evolution in just a few years.

The venue will be in a hotel meeting room with all the necessary
A/V hookups for PPT, DVD, VHS etc I assume. Show & tell can be
on a sidebar table during breaks or embedded in your talk - your
call.

The number of presentations has also grown, so keeping your pitch
as concise as possible may be important.

That's about all the guidance that I can give you, based on having
done 3 GPSLs so far. Perhaps Zack can provide further?

The Grand Prairie claims that they're reserving roughly 30 rooms up through the middle of July for us. They may not have it in their systems because they don't have the signed contract back in their hands yet.

The GP may be a little more expensive at $74 a night, but I'd be inclined to recommend them. In all honesty though, the Microtel is well within walking distance.

I'll get the contact back to those guys this week so you can switch reservations if you like.

Zack

Date: 2006-04-17 01:23:35 UTC
From: Harry M
Topic: 2223 Message: 2226

Thanks Zack!

I just called them and they do have the GPSL rooms for the 4th & 5th @ $79 + tax. They had an opening on the 3rd so I made my reservation for the 3-4-5. I wanted two beds, but they only had a room for the three nights with one king bed. I was told the rooms with a king bed have a foldout couch so that works for me.

I will cancel the Microtel reservation.

Anyone out there got a line on a relatively cheap CO2 sensor that could be flown on a balloon payload? The smallest/lightest I've seen requires 10V at nearly 200 mA and is rated for only 0-50°C.

Announcing
*SmallStat 2006
*A conference on Small Balloon Science, Technology and Operations
18 - 19 September 2006

Conference Web Site: http://www.ia.spacegrant.org/smallstat/

This event is open to Researchers, Students, Amateur Radio balloonists
or anyone interested in small balloon activities. Distinguished
speakers from Government (including FAA, NASA, NRL and Air Force),
Industry, and Academe will present in plenary session as well as invited
speakers in technical sessions (see web site for Call for Papers).
Please broadly distribute this announcement and encourage abstract
submissions.

The event includes a *STUDENT POSTER SESSION* with a top prize of $1000
plus a ballon from Global Western, $750 2nd place, and $250 3rd place.
A huge corporate recruiting event with over 200 companies is held in
conjunction with this event.

Prize Drawing for Amateur Radio Operators to win a Balloon from Global
Western

I hope to see you and your colleagues there.

Bill Byrd
Conference Host

SmallStat 2006 is an activity of the Great Midwestern Space Grant region

Hi Pete,

Well, no one can blame you for asking a previously unanwered question!

Now, I don't have an answer, but I've cc'ed Norm Kjome of UWyo fame
to this reply, as well the Great Plains Super Launch email reflector,
where many of the more experienced US amateur balloonists hang out.
Perhaps they can tell you the answer straight away.

Lacking any luck there, suggest you Google for Kaysam balloons. Kaysam
of Japan is one of the few latex balloon mfrs left, and they may have
a web site that shows EU distributors. Their US distributor is Kaymont
in New Jersey.

You might also check
with your national weather service - it's likely that they launch
at least two radiosondes daily from the UK. You might also Google
to Vaisala, the Finnish mfr of widely-used radiosondes.

If that draws a further blank, keep rattling the cages! There's got
to be a source on your side of the big water. I've heard of
amateur balloon flights going out of Poland and Spain recently.
Perhaps Ralph Wallio can point you to their web sites.

I contacted Totex via e-mail and then via phone about 20 months ago. They basically stated that "Their distributor in the US was Kaymont. Please contact Kaymont and don't bother us anymore." (t sounded curt but was probably just alanguage issue.)

73 de Troy KC0MIC

Mark Conner <mconner1@...> wrote: Totex is the Japanese manufacturer of the Kaymont balloons. I believe Kaysam made their own until they went out of business last year.

Kaysam was in New Jersey, Kaymont is based in New York.

The Totex web site is hard to find and has minimal English content. I couldn't really tell if their Japanese page was any better.

Good luck with your search.

Hi Mike,

Kaysam went out of business a year ago....unless they have overseas operations still in effect?

Totex is the Japanese manufacturer of the balloons distributed by Kaymont in the US.

Scientific Sales distributes balloons made by a competitor of Totex in Japan called the "Weather Balloon Manufacturing Company". They are both manufactured with a similar rolled one piece method.

You can still find Kaysam balloons surplus and I still have some 2000 and 3000 gram balloons from Kaysam's going out of business sale.

A while back somebody was asking about a VCH-1 SSTV communicator. I have
used mine about a half dozen times and am interested in selling it. Would you
happen to know of someone interested in buying this? Tony,N8WAC

Hi Pete,

Yeah, I think one of the other folks on the GPSL reflector mentioned that Totex factory folks aren't very chatty. Just tell 'em you're running under 2 kg - but DON'T tell 'em that EOSS-103 and -104 just hauled up over 11.8 kg on two of their 3000 gm latexes to 87 and 99K ft this past weekend! We've been doing that for over 30 flights already with impunity.

We have developed a fill and lift spool that minimizes the stress on the neck, however. It's a PVC pipe reducer that fits snugly into the neck and is held in place with a screw-type hose clamp. The 1/2" NPT end fits our Helium fill hose, and the flange is outfitted with a 4-line load harness. After fill, the fill pipe is replaced by a threaded plug. I think there are photos on the EOSS web site somewhere.

I have some machine tools from India, and am quite happy with their workmanship. Since Totex is our sole source now, I'd be interested in learning more about that Indian manufacturer.

It's time to start thinking about your flight train for GPSL this year. If you or your group intends to fly out of Hutchinson this year, please provide me with the following:

(Note: Even if you're not sure of all the parameters at this point but do intend to fly, please let me know so that I can assign the time-slots an anticipate the gas requirements.)

1. Name of your group

2. Website for your group

3. Callsign(s) of your payload

4. A cellphone number that will be carried on the chase (for post-recovery coordination)

5. Number of transmitters and their band (specific frequencies only if you're rock-bound or don't wish to be time-slotted with others on the 144.34/39 freq).

6. Size of balloon

7. Approx number of helium tanks required (K or T)

8. Total flight weight

9. Expected ascent/descent rate

10. Projected burst altitude

11. Special requirements/requests for the GPSL coordinator

12. Short description of your payload including cameras, transmission modes, experiments, etc.

Hi Zack,

I dunno. I'd considered flying the load-dump release that I'll be talking about Friday, or if we get some good results from the B-LAN, maybe the valvedown scheme that really needs that link. Not sure ATV is of general interest to the group, but if it is, we can time-share 426.25 with Bill 'ELK again. Heck, maybe even a two-fer if the T&R crew is up for it in a "ferrin land".

In any event, I assume that we'll be limited to FAR-101 exempt payload weights, right?

Any thoughts or preferances from you or the gang?

Hi Pete,

Well, they probably aren't interested in talking directly to
customers - that would be skipping over their distributors.
They do make a good product, and deliveries are timely. Guess
they didn't mention an EU distributor? And yeah, your met
office might be the best contact for a balloon supplier.

Thanks for passing on the Jemco Rubber brochure. I've fwd'd
it to some of the other heavy users over here in case they're
interested in an alternate source. If you learn more, could
you copy the GPSL@yahoogroups.com reflector?

2242. Ozonesonde tracking info

Yahoo group: GPSL (2002 — 2008)
Date: 2006-05-01 01:04:20 UTC
From: wb8elk@aol.com
Topic: 2242 Message: 2242

There are some interesting new ozonesonde launchsites during the month of May and also in August.....attached is a list of the operational sites....they typically launch around 1 pm local time and operate at 300 baud ASCII AFSK between 401 and 403 MHz wideband FM.

They are a lot of fun to track and recover and you get a $30 reward for returning the package.

Of particular interest for easiest recovery areas are the ones in CA near Los Angeles (Table Mountain), Valparaiso IN, Boulder CO and Huntsville AL....the one in Indiana has GPS onboard.

Attached is the website showing the launchsites and coordinates:

http://croc.gsfc.nasa.gov/intexb/ions06.html
(http://croc.gsfc.nasa.gov/intexb/ions06.html)

The typical flight profile for those of you wanting to narrow your odds with Balloon Track is: 900 ft/min ascent rate and 1100 ft/min descent rate with a max altitude of around 110,000 feet.

I usually can locate them using a 3 element Arrow with attenuator inline....and use either an ICOM R-3 or AOR 3000...anything that can tune in wideband FM between 401 and 403 MHz (AM mode will also work for added sensitivity)....in Huntsville they usually use 402.5 MHz.....the transmission will drift up to
0.5 MHz either side of center.

The current campaign of ozone soundings will be upwards of several times a week from each location and will continue until mid-May and then again in August.

- Bill WB8ELK

2243. Combat Balloon To Improve Communications

Yahoo group: GPSL (2002 — 2008)

Combat Balloon To Improve Communications

Space war, by 1st Lt. Elizabeth Kreft, Nellis NV (AFPN) Apr 26, 2006

Warfighters who depend on ground communications for mission success will soon have improved technology, thanks to a system currently under examination here at the 2006 Joint Expeditionary
Force Experiment.

Combat Skysat uses balloons to take advantage of untapped airspace and improve line-of-site ground
communications.

"The former Air Force chief of staff, General (John P.) Jumper, wanted to explore the 'near space'
realm," said Maj. Shawn Bratton, 111th Space Operations Squadron detachment commander. "Between
where the satellites live and where the planes fly is a chunk of space where nothing is operating."

Skysat is a radio repeater platform launched into near-space. It is attached to what can be compared
to a weather balloon and can transmit information hundreds of miles farther than traditional radios.
Cruising altitude is between 65,000 and 95,000 feet.

"It simply changes the line of sight," Major Bratton said. "Special operators or any military member
who either goes on convoy operations or works in an urban environment can benefit from it."

Hilly terrain or thick walls in an urban environment can weaken radio transmissions, but if the
signal is bounced off an aerial platform, it not only allows for clearer transmissions, it extends
communication range.

"The standard ground radio range is roughly 5 to 10 miles, but with Combat Skysat, warfighters can
exchange information over more than 600 miles," Major Bratton said.

In the past, satellites were used to provide the long-range relay ability for ground communiqu?, but
the lines were often clogged with high-priority information and were too slow for the fast-paced
ground environment.

"The satellite bandwidths are always heavily tasked, so Skysat provides a clear channel just for
ground communication," Major Bratton said.

The balloon takes about 20 minutes to launch, but can stay in the air an average of 12 hours per
flight. It is remotely flown from the launch site through ballast and vent controls, much like those
on a hot-air balloon.

Depending on the hostility of the environment, the balloon either can be retrieved for future use or
left behind.

"It was created to be disposable," Major Bratton said. "Since it's basically just a bent pipe
repeater the size of a coffeemaker the entire platform is relatively low-priced."

With the cost of commercial geosynchronous satellites averaging more than $300 million a pop, the
$6,000 skysat makes "low-priced" seem like a slight understatement.

"Yes, it is definitely cost-effective," the major said.

The cost may be low, but the capabilities Skysat provides to the warfighter are extremely valuable.

"Communication is imperative to a special operations team," said 1st Lt. Rodger Jennrich, special
tactics officer with Air Force Special Operations Command. Lieutenant Jennrich is one member of the
JEFX Combat Skysat examination team, and he says what he's seen so far is an outstanding improvement.

"Skysat will offer operators a variety to their communications package, which will allow us to get
information back faster," Lieutenant Jennrich said.

Additionally, ground operators won't have to carry two antennas to achieve long-range contact.

Topic: 2112 Message: 2245

Keith Kaiser, WA0TJT, with Near Space Ventures has updated the Google Map interface from version 1.0 of Googles API to version 2.0.

Good things:

1) It works with Internet Explorer >= build 6.0.3000
2) There are signifcant user interface enhancements.
3) In most cases, it's WAY faster than it was.
4) Map size is dynamic. It will use all the space you can give it.

Known Bugs
1) Occasionally, the Google map API will try to do an area-fill using a series of lines when it detects a curve that "doubles back" in direction.
2) The 'drive-too' directions pop-ups don't pre-populate the addresses as they once did.

An altitude-vs-time graph was added and we'll be adding graphs as we have time.

Keith has done a fantastic job on the map interface. We hope the project will be useful.

You can try it out at http://nearspaceventures.com/w3Baltrak/readyget.pl

DoD Experiments With Balloon-Borne Communications Tech

DOW JONES NEWSWIRES , By Rebecca Christie

WASHINGTON (Dow Jones)--Inexpensive balloons may be the next frontier of Pentagon communications technology, if a recent Defense Department test exercise is any indication.

A balloon that costs $7,000 or less can launch in about an hour and relay signals several hundred miles in all directions. In the recent Joint Expeditionary Force Experiment, this translated into coverage from San Francisco Bay to Colorado, officials said.

The balloon technology was developed for oil fields in remote parts of the Gulf Coast but may soon head to the battlefield.

Lt. Gen. Michael Peterson, the Air Force's chief information officer, said Thursday that the balloon system received rave reviews during the event.

"As soon as he heard about this: Go. Buy. Now," Peterson said of one general's reaction. Peterson spoke at an Air Force seminar on Capitol Hill aimed at congressional staffers, reporters and industry officials.

The balloons fly at around 80,000 feet, far above air traffic, weather and even most wind. They are far cheaper to buy and launch than military space satellites, which cost billions of dollars and take years of complicated development.

A single balloon lasts at least four to six hours and is relatively stable once it reaches the upper atmosphere, said Devin Glenn, a Northrop Grumman Corp. (NOC) contractor who worked on the experiment. The balloon systems are made by privately held Space Data Corp., based in Arizona.

The single-channel balloons can't do everything a military satellite can do, said Air Force Col. John Amrine, the event's director of space forces. But they can relay signals over the horizon and provide a steady channel for emergency communications. And they can be ready in a hurry.

"One of the biggest pluses of this capability is that it's responsive. To launch a satellite is still one of the most complex things that we do here on this earth," Amrine said in a recent telephone interview.

The balloons are one of many new technologies that auditioned during this year's JEFX event, Amrine said. The event aims to test new technologies that could be ready for combat within 18 to 24 months. It also gives the U.S. military forces a chance to see how their new equipment works in a group setting.

The balloons are six to seven feet across at ground level, expanding to about 30 feet at high altitudes. The system operates in an area known as "near space" that is one of the Air Force's growing interests.

"It's very, very inexpensive. You can basically break one out of a box and have it ready to launch in about 20 minutes," Glenn said. "If you had it in Iraq, it would cover 80% of the country. If you had it flying over Afghanistan it would cover about 75% of the country."

Congrats, Harry!

Sorry to hear the 2.4 GHz ATV range was limited, but guess that's
about all you can expect from a Part 15 xmtr. Move it down into
the ham band and fit it with 1+W boots and you might have better
range - a long beam and LNA on the ground will help as well.

From time to time, I've had trouble getting cutdown commands off as
well, but only after burst. I'm guessing that PBC spin modulation
is making it look like I'm sending multiples of the same DTMF key.

Hi Mike,

The xmtr was a Part 15 Wavecomm that I modified by removing the 9db
pad and added a 20db HP MMIC amp. I have not had a chance to put
it on an analyser to see what the PO is. The rcvr was also a Wavecom.
I had one that I added an HP MMIC preamp to, but for some reason it
was not working properly and I had to use one that did not have the MMIC.
The rcv antenna was a double cantenna approx 11" x 4" mag mount on
the roof of the Jeep. Not sure what the gain is, but on the analyser the
worst swr was 1.75 at 2450 mhz. The micro-wheel on the payload was
1.9-2.0 vswr at 2435 mhz. I will get the xmtr on an analyser and do some
range testing in the future.

I have witnessed your multiple cut-down command tries. In my case it was
before burst. My son stopped under some high voltage primary feeder lines
on my first two attempts. I didn't notice them at first. I had him drive
down
the road away from them and ran the pwr up from med to high on my mobile
for the last two commands. There is also the possibility that there is
interference
on the channel sometimes. I do issue the command after a beacon from the
balloon
to eliminate that as a source of interference. Hey... It's all MAGIC!!!

73

What is the URL for the online BallTrak program? I couldn't find it with Google.

Thanks,
Paul

It's at:

http://nearspaceventures.com/w3Baltrak/readyget.pl

The Google map interface is really nice.

Hi Harry,

Well shuckins - seems you really shoulda got a decent ATV sig farther out. Maybe the Wavecom rcvr has a squelch setting that's too high (> P4?). Would be nice to learn how to make 2.4 GHz WBFM ATV work, since 70 cm AM ATV can be a nasty source of EMC - even getting into GPS receivers. WE know it plays havoc with 433 MHz Part 15 wireless!

BTW, what's a "cantenna"? Heathkit used that name for its 1 KW HF dummy load in a 1 gal paint can filled with mineral oil, as I recall from longer ago than I care to think :={.

If you were right under the balloon when you sent your cutdown from from the mobile, the sig mighta been attenuated by the mobile whip pattern which features a deep null off the end. QRM from over your ground-level horizon is always a worry - would be interesting to downlink what your command receiver is hearing on a different band (e.g. a crossband repeater :=}.

Isn't a "cantenna" a microwave antenna made from a pringles can or coffee can?

Troy

BTW, Mike I've still got one of the Heathkit dummy loads of which your speak. Shows my age don't it?

Hi Troy,

I supervised the electrical construction for the Pringles pilot
production plant in Green Bay WI in '73 ... sonny! :=}

And the Pringles can is just a bit small for efficient 2.4 GHz
waveguide; about all it does is provide a lot of directionality
along with some loss re simple half-wave (2.5") dipole. A coffee
can would work a lot better.

You're absolutely correct. Moreover, the coffee can is easier. The pringles cantennas just had a "cool" factor about them when they were first discribed in 2002.

Pringles:
http://www.binarywolf.com/249/pages/bwpringlescantenna.htm

Coffee can:
http://www.binarywolf.com/249/coffee_can_antenna.htm

Big Soup Can: (best link)
http://www.turnpoint.net/wireless/cantennahowto.html

My favorite for "coolness factor" is a parabolic antenna using an oriental frying basket and a USB 802.11b/g dongle:

Mike,

As we drove on the recovery I had snow in and out some times
on my camcorder from the ATV. I looked at the video yesterday
and there is one segment of perhaps a second or two of P3-4 picture.
I'll look at it in detail later. My PC blew a hard drive and I've been
reloading from a backup drive. The micro-wheel antenna might not
have been the best choice. Ralph suggested a patch antenna.

Ralph, if you read this, I lost your email about the ATV. If you still have
it
in your sent box would you resend it please.

I shoul have said can-antenna or circular waveguide! Mine is 98mm x 273mm
and is made from 2 juice cans. I have an xls file I got off the web that
campares
several canantenna sizes. I have also built the "optimal" cantenna listed in
the xls,
but have not tried it yet.
http://www.concentrate.com.au/misc/circular_waveguide_optimise.xls
Another good site is...
http://www.turnpoint.net/wireless/has.html#shootout

The antenna antenuation is a good possibility. I used a 5/8 wave instead of
my
normal 1/4 wave mobile antenna and it would have a bigger vertical null.

Hi Troy... I also have one or two of those old dummy loads! :)

The can-antennas tickled me. I built a couple just for 802.11b/g but never tried it with ATV. I'm a member of the local ATV club (kcatv.org) but no one has ever brought one to the club meetings. They seem pretty stuck on yagii , Though one of the guys has launched several ATV packages using wheel antenna.

On another but similar topic, has anyone tried using turnstiles (crossed dipoles) either on the payload or on the ground ? (I'm curious, but not curious enough to spend a lot of time if it has already been explored and discarded.)

Hi Troy,

Thanks for the links. "Better to light a single candle ..."

Besides being a bit small in diameter at 2.4 G, the pringles can has
pretty poor conductivity in the foil lining (discontinuous spiral).

BTW, the general rule of thumb is that a dish should be at least
10 waves in diameter to be effective (has to do with getting a feed
with good illumination) - so that would require a BIG wok - over
4 ft diameter. Try hauling that out to the landing site at XXX MPH!

The uWave guys generally use many-el loop yagis at 2.4 GHz if a 4 ft
wok doesn't show up in the neighbors' yard sales :=}. A corner
reflector made with E-field rods spaced at 1/8 wave max also works
well and doesn't yield as much aerodynamic drag. Also much easier to
build.

Harry said he's using a pair of 3 7/8" diam juice cans stacked, which
oughta work OK as waveguide at 2.4 GHz - but still not much of an
aperture. Adding a horn made from a big metal funnel would help.

Hi Harry,

If the "micro-wheel" is the standard 3 half-waves fed in phase and
forming the sides of a "bulgy" equilateral triangle, then it should
work better out to the horizon than a patch, while a patch will give
give a better pattern straight down. The wheel oughta yield about
5 dBd gain at the horizon, and the patch will show a null out thataway,
assuming both occupy a horizontal plane, that is.

Re the snow: Pretty unusual for Wichita in May, huh?? :=} Altho WBFM
will yield better pix while the rcvr IF is in limiting, it goes south
fast once the sig drops outta limiting. So the same received sig
power that yields P1-2 for AM will yield nada for WBFM. But a P3 AM
sig will prolly be P5 with FM.

Re the null from the 2m mobile: if you use a mag mount, you could
try sticking it to the side of the vehicle when the bird's overhead.
We had to do this at the ground station last summer when one of the
balloons came back directly overhead.

I have a pic of the micro-wheel on the ORB Yahoo Groups FILE area.
I used the same fomulation you'd use for a big/little wheel.

WICTHITA?????
Is that in the US?
Is it just north of TULSA! :)

I wanted to see the difference in signal strength of the cw beacon on the
ground using the 5/8 wave over my 1/4 wave this time, but when your
right on with the prediction you don't have an oportunity to do that. Like
Rick (N0KKZ said, I almost got the Redneck balloonning award...
The "recovered in the bed of my pickup" award.

Chow Amigo!

2262. Possibility of APRS on Clusterballoon this Sunday morning

Yahoo group: GPSL (2002 — 2008)
Date: 2006-05-28 04:09:56 UTC
From: wb8elk@aol.com
Topic: 2262 Message: 2262

There is a chance I can put an APRS tracker on the Cluster Balloon fellow when he flies out of the Alabama Jubilee hot air balloon festival Sunday morning around 1200z.

WB8ELK-12 on 144.39 (every minute)

http://www.clusterballoon.org (http://www.clusterballoon.org)

This Saturday, members of the UAH balloonsat club were out in force to help him inflate his 72 large party balloons (28 tanks of helium) and we were halfway finished when lightning started to crash all around and we were suddenly drenched by torrential rains and hail from a pop-up thunderstorm. He will try again this Sunday morning at 7:00 am CDT.

Decatur, AL - Point Mallard Park

2263. WB8ELK-12 Cluster Balloon APRS has flown but had bad antenna

Yahoo group: GPSL (2002 — 2008)
Date: 2006-05-28 16:07:46 UTC
From: wb8elk@aol.com
Topic: 2263 Message: 2263

I attended the launch of the Cluster Balloon this morning and he agreed to fly my APRS payload attached to his water ballast containers.

Over a dozen UAH students from the Balloon Club helped inflate the balloons in teams from 28 tanks of helium. The UAH students also chased and helped deflate the balloons...he reuses the larger balloons (the 8 foot advertising balloons).

It was a perfect launch around 7 am with his amazing cluster balloon system consisting of 72 large party and advertising style balloons.

The flight lasted about an hour and he landed gently in front of us in a field next to I-565 at the Mooresville road exit a few miles northeast of Decatur, AL. He has such fine control of his balloon system that he flew across the interstate just 40 feet up.

I even got to do a tethered ride ... amazingly smooth ride and very comfortable...I'm going to rush out to Walmart and get a lawn chair and a bag of party balloons now...I'm hooked !!!

Unfortunately, we lost signal on the APRS payload very shortly after launch....When I put it into my car I surprised to see that it was apparently working just fine.....I opened the payload up and finally figured out the problem....I had to use a small antenna so as to not poke into his ballast bags, so I grabbed an MFJ-1716S dual-band antenna I had in my car. Upon close inspection, the center pin on this particular antenna is recessed pretty far inside the threading and does not make contact when screwed onto my Alinco DJ-C7 since the C7 has a raised ridge around the antenna connector....so essentially I flew without an antenna attached <sigh>.

Hopefully some other balloon group can piggyback a tracker with him during one of his next shows this year:

http://www.clusterballoon.org (http://www.clusterballoon.org)

Hi Paul,

Gosh, that looks like the Dreaded Fouloglopolus (shardia latexius)!
Infection symptoms range from minor topical contamination to full-
blown parachute inversion; may also be accompanied by PBC.

There is no cure, but I plan to present a D.F. repellant scheme at
GPSL this summer.

Following clip from ARRL Letter V25 #22 of 6/2/06:

73 de Mike W5VSI

==>TWO RADIO AMATEURS DIE DURING MOBILE HIDDEN TRANSMITTER HUNT

Two ARRL members from California are dead after the vehicle in which they were riding during a mobile hidden transmitter hunt May 27 went over a cliff in rugged terrain near Lake Isabella in Kern County. They were identified as Michael G. Obermeier, K6SNE, of Anaheim, and David A. Gordon-Ross, N6IDF, of Yucaipa. Obermeier, an ARRL Official Observer in Orange County, was 46. Gordon-Ross was 35.

"Mike and Dave were some of the best T-hunters in the biz," said Scott Press, N6SAP, calling both "true assets to this hobby." In his role as an OO, Obermeier reportedly had participated in the infamous Jack Gerritsen radio jamming case in the Los Angeles area.

According to media accounts, a Kern County Sheriff's Department search-and-rescue team located the victims early Monday, May 29. Obermeier was driving the 1991 4-wheel-drive Jeep Cherokee that apparently went out of control on Cook Peak Road while the pair was proceeding to the next hidden transmitter site. After caroming off a rock wall, the vehicle crossed the road and plunged down a 900-foot cliff. They were reported missing after failing to check in with T-hunt organizers.

Greg Pitta, KF6DBJ, reports Obermeier and Gordon-Ross were on a half-day multiple-transmitter T-hunt. "Both K6SNE and N6IDF were expert transmitter hunters, each with hundreds of hunts completed, ranking with top scores in most," he said.

ARRL Amateur Radio Direction Finding (ARDF) Coordinator Joe Moell, K0OV, knew both men. He notes that Obermeier had suffered a sports-related spinal cord injury that left him a paraplegic. "He did all the adaptive work on his vehicles, of which he had quite a few that he used over time for RDF," Moell said. Despite his physical limitations, Obermeier also enjoyed foxhunting from his wheel chair.

Moell says Gordon-Ross had been a proficient mobile T-hunter for many years. He took a brief hiatus after his first child was born in April 2005 (his wife, Melanie, is KF6GWV), but he recently became active again.

According to Moell, the mobile transmitter hunts take place on the fourth Saturday of each month on 2-meter FM simplex, starting out from a hilltop in Rancho Palos Verdes. He says it's not uncommon for the main hidden transmitter to be hundreds of miles away--175 highway miles in this instance.

The 147.435 Amateur Radio Repeater System is collecting donations to help Melanie Gordon-Ross, a stay-at-home mom. It also will donate all proceeds from its 16th annual 435 Chili Cook-off June 10. Visit the 147.435 Web site <http://www.435online.com> for additional information.

Apparently two students pulled down an 8-foot advertising balloon in an arena and were found dead INSIDE it....how they managed to do that is beyond me.

2271. Hotel Rooms for GPSL

Yahoo group: GPSL (2002 — 2008)
Date: 2006-06-06 02:15:12 UTC
From: Zack Clobes
Topic: 2271 Message: 2271

The Grand Prairie Hotel and Convention Center called me this afternoon asking if they could release some of the rooms that they have reserved for GPSL. We have 30 rooms reserved, but only approx 5 rooms have been taken.

If you are considering staying at the hotel for the GPSL, I would recommend that you make your reservations very soon, as they will probably start releasing them in the next week or two.

The hotel's website is http://www.grandprairiehotel.com/ You can call toll-free at 1-866-KS-SPLASH.

We have a group rate of $74 a night (plus taxes) which is in the same building as the symposium, has an indoor water park, and nice restaurant.

Zack

Hi Zack,
Just for your information, folks who are arriving 8/3 can not get rooms until 8/4. The GPSL block of rooms starts 8/4. If you could ping the hotel management and add 8/3 onto the block, you might get more success. Of course, that's from the perspective of folks traveling 500+ miles:>)
Good luck,
- Marty, WA0GEH, EOSS

From: Chris Krengel
Topic: 2277 Message: 2277

For those of you that were not able to get a room for the 3rd of Aug. I
just called the Grand Prairie and got a room for all three nights.
maybe they were just not sure that the room would not be needed so I
think if you tryed to get a room earlier and couldn't you may want too
try again asap!!

Thanks for the information. This was simply an over site, and I'm
working to get this resolved as quickly as possible.

2280. Re: [GPSL] Hotel Rooms for GPSL

Yahoo group: GPSL (2002 — 2008)
Date: 2006-06-06 21:28:30 UTC
From: Harry M
Topic: 2271 Message: 2280

The Hotel is very non-consistent with their rates.
I booked mine last month for the 3rd though the 6th
and the rate was $79 per nite. I wonder what it will
be at check-in?

I think an explanation from the Hotel manager or
Corporate is in order!

From: Mike Manes
Topic: 2273 Message: 2281

Hey, thanks, Ralph! Wow ... this balloonacy has become epidemic!!
And I guess these are just the flights that came to your attention.
I know that several colleges don't post their announcements, e.g.,
Mt State and SD Sch Mines. So the term "at least" is fitting, right?

2282. Re: [GPSL] Hotel Rooms for GPSL

Yahoo group: GPSL (2002 — 2008)
Date: 2006-06-07 00:23:00 UTC
From: Zack Clobes
Topic: 2271 Message: 2282

I just spoke with the lady at the hotel.

Harry, they should be adjusting your room rates. I told them about your experience back in April, and they said that they would take care of it so make sure you get the discounted rate.

As for everyone else, she has to check things out tomorrow, but there shouldn't be any problems extending the group rate into Thursday. Thursday was originally in the contract, but somehow got dropped and I failed to notice it. Hopefully things will be straightened out by tomorrow afternoon.

At this point, they are holding our block of 30 rooms open until the weekend of June 17th. After that, the rooms will be fair game to anyone, so if you're going to stay with the rest of the group, please make your reservations soon.

2283. High-Altitude Chamber available at GPSL?

Yahoo group: GPSL (2002 — 2008)
Date: 2006-06-07 02:10:47 UTC
From: Zack Clobes
Topic: 2283 Message: 2283

I'm trying to arrange to have a small (6 inch cubed?) altitude chamber available to anyone to use during Friday's events. Does this hold any air (or lack thereof) for anyone, or do most groups have access to this type of equipment?

Zack

2284. Re: [GPSL] Hotel Rooms for GPSL

2297. DO NOT open mail with "New Graphic Site"

Yahoo group: GPSL (2002 — 2008)
Date: 2006-06-12 21:41:03 UTC
From: mconner1@gmail.com
Topic: 2297 Message: 2297

DO NOT open any emails with the subject "New Graphic Site". The mail may appear to come from a legitimate Yahoo list member. Opening the e-mail is enough to cause the worm to spread. One of the lists I manage has already been hit with this.

73 de Mark N9XTN

http://www.pcworld.com/news/article/0,aid,126048,00.asp

Worm Attacks Yahoo E-Mail

Mass-mailing worm exploits a vulnerability in the Web-based e-mail, but its impact is low.

Jeremy Kirk, IDG News Service
Monday, June 12, 2006

A mass-mail worm that exploits a vulnerability in Yahoo's Web-based e-mail is making the rounds but the impact appears to be low, security vendor Symantec said today.

The worm, which Symantec calls JS.Yamanner@m, is different from others in that a user merely has to open the e-mail to cause it to run, said Kevin Hogan, senior manager for Symantec Security Response. Mass-mail worms have usually been contained in an attachment with an e-mail note encouraging a user to open it.

The worm, written in JavaScript, takes advantage of a vulnerability that allows scripts embedded in HTML e-mail to run in the users' browsers. Yahoo users should be able to modify their settings to block the zero-day exploit, Hogan said.

Symantec rated the worm a Level 2 threat, one notch above its least harmful ranking. Hogan said the worm did not appear to be spreading widely, and he did not anticipate the threat level rising.

How It Spreads

When activated, the worms then sends itself to other users in the victim's address book who also use Yahoo e-mail with the suffixes of @... or @yahoogroups.com. The worm mimics a function within Yahoo's Web mail called "Quickbuilder," which allows a user to add contacts in an address book from received e-mail, Hogan said. The process, however, is transparent to the victim, he said.

The harvested e-mail addresses are sent to a remote server. Users of Yahoo Mail Beta do not appear to be affected, Symantec said.

The worm also opens a browser that displays a Web page that does not appear to contain malicious content.

Although Yahoo's Web e-mail has not been fixed, users are advised to update virus and firewall definitions and block any e-mail sent from av3@.... The subject line of the e-mail with the worm says "New Graphic Site," and the body says "this is test."

Yahoo officials could not immediately be reached for comment.

Paul,

Yes, I need to get busy and take care of the authors again. Dayton happens right after the Spring issue comes out and with getting ready and follow-up from Dayton it is easy to forget.

The article that was in the Spring issue was titled "The FITTS 2005 ARHAB Launch."

Paul,

Yes, I need to get busy and take care of the authors again. Dayton
happens
right after the Spring issue comes out and with getting ready and
follow-up
from Dayton it is easy to forget.

The article that was in the Spring issue was titled "The FITTS 2005
ARHAB
Launch."

Gene, I emailed an article last March. I haven't seen a copy of ATV
Q,
so I'm not sure you got it. If not, I have an article right now.
Otherwise, I'm starting one on last month's balloon launch.

Paul

>>> atvq@... 6/11/2006 11:29:20 am >>>
July 1st is the next deadline for articles for ATVQ. Please advise
what
might be expected.

Anyone have pictures from Dayton?

Don't forget, the ATV Contest is under way!

Let me know what you will be sending.

Thanks.

2302. Helium Orders for GPSL

Yahoo group: GPSL (2002 — 2008)
Date: 2006-06-20 17:21:45 UTC
From: Zack Clobes
Topic: 2302 Message: 2302

I now have the helium order form posted on the website. Note, there is a deadline for ordering gas of Wednesday, 19 July.

http://www.custom-ds.com/gpsl/helium.pdf

I am in the process of moving, so please send the checks to the PO Box listed on the form so they don't get lost in the transition.

They will refund untapped bottles. I plan on having at least two tanks
available as backups.

If you only need one, just purchase one - that way I don't have to
figure out who I owe money back to.

Zack

Topic: 2304 Message: 2305

Good Morning, Mark - Near Space Ventures is interested and there will be at a minimum 2 and perhaps 6 or more shirts ordered for our group.

Thanks for doing this again. I liked the shirts last year and the fact that there was a nice t-shirt for women also.

Sent: Tuesday, June 20, 2006 11:59 PM
To: GPSL@yahoogroups.com
Subject: [GPSL] T-shirts?

Are people interested in ordering T-shirts this year? I am thinking of doing something along the lines of what we did last year with zazzle.com. The front would be similar with the ARHAB logo on the pocket area, but I would like to use a new photo for the back. If you have photos you'd like to have considered for the shirt backs, e-mail them to me at n9xtn@... - they may not make it through the e-mail lists. Landscape orientation is preferred, but a good portrait one may work. Resolution should be at least 1024x768 to prevent pixelation when printed.

Shirts would be on the order of $18-22 plus postage when ordered individually. I would suggest each balloon group order their shirts as a group to save shipping and to get a quantity discount.

I would like to get the stuff online in the next couple of weeks so people have time to order them and have them arrive before they leave for Hutchinson. If you are interested in a shirt, also e-mail me - if there are enough people to make it worthwhile I'll work on the design.

2308. New generation HTs lack external power connnector

Yahoo group: GPSL (2002 — 2008)
Date: 2006-06-21 21:22:18 UTC
From: Hank
Topic: 2308 Message: 2308

A newbie recently asked about a good HT for balloon APRS use.

I was dismayed and very surprised that just about all of the new HTs (last 2 years maybe) are not equipped with an external power jack. Even for ordinary terrestrial use I have to be able to have this feature.

What is going on here? Just a marketing decision type thing? Something about lithium batteries in some instances?

To me it's a bad trend.

Hank

The Yaesu VX-2R has an external DC jack. Coincidentally, it’s the same size as most chargers for cell phones with a coaxial plug. I found this out a couple weeks ago and was kicking myself for throwing out a couple of old chargers. Now I need to see if I can get some cheap ones on eBay.

>Specifically which HT model(s) have you identified as not having
>external power connectors?

Kent,

It was actually just about every model of 2 meter-only HT
in current production by Icom, Yaesu, and Kenwood!

The lack of this feature is not brought out in advertising,
or even in the web site "spec sheets" on the radios. In most
instances, one has to download the entire user manual
(typically pdf) and read the fine print.

I'll have to search my old email to come up with the
model I did suggest, but I can tell you it had a weird
connector for the speaker/mike instead of what has become
unbiquitous and a de facto standard, the dual mini plug
setup.

I hope that doesn't go by the wayside, although if any
new connector type does take over, as long as it's widely
available from other than the HT OEM it wouldn't be too bad.
I don't believe this one is (readily available), therefore
you have to buy the radio manufacturer's special adapter
at a cost of $8.

Greetings Everyone.

In a great box of donated goodies for balloon flights I have found a mystery APRS Unit.

No one here has as clue as to who made it.

It looks like home made but from commercial made components.

But i have no more information than that..

Its in the photos area in the NSS Album.

Anyone have information for mE?

Hi Hank,

It's usually not a big problem to tack pigtails onto the
the + and - battery pack terminals and run them to your
own batts (LiSO2 still appear to be best). Li-ion is not as
tolerant of low temps as those primary cells.

If the radio comes with a Li-ion rechargeable, then it's gonna
need a specialized charger, lest one release the Sacred Smoke.
The Alinco DJ-C1/4/5 series credit card HTs came with 4.3 V Li-ions,
but I replaced the batts with regulated +5.0V used by the GSP
engines; they work fine w/ an extra 50mW RF output.

The biggest headache with the newer rigs is the pushbutton power
switch, e.g DJ-7. They don't power up when external power is
applied, so one must dig into the payload at launch rather than
just hitting an external switch or inserting a power jumper. I was
able to install a mod to get around this on the Magellan Etrex
GPS (on eoss.org), but the DJ-C7 power PB goes straight to an IO
pin on the uP - not sure how to trick that one, but Larry K0ANI is
working on it.

You might advise your newbie to hit the web or E%^& for a used
DJ-C5 dualbander. It does take a little surgery to bypass the internal
matching network and get coax to the 50-ohm tx/rx port, but it's
worth the trouble. The DJ-C1 2m-only HT is easier to add coax to,
and would be fine for getting into the APRS backbone. W/O batts and
with 6" of RG-174 to a BNC female, they weigh just 70 gm.

That GPS looks like a Motorola Oncore of some sort. And my guess about
the board behind it is a home made TTL to serial level converter perhaps
with the 5V power supply that the Oncore needs.

Mike,

Thanks for another info-packed post that has a bunch of good
tidbits.

> It's usually not a big problem to tack pigtails onto the
> the + and - battery pack terminals and run them to your
> own batts (LiSO2 still appear to be best).

I'm not one (like many on the list) to shy away from equipment
surgery, but I'm drawing a line in the sand on this external
power connector (EPC) issue for ordinary HT use on land.

I'll try mightily to only buy HTs as long as anyone makes rigs
with some kind of connector. If it looks like the EPC is
already being phased out, it might not be too soon to start
writing letters to Alinco, Yaesu, Kenwood, and Alinco to try
to reverse, or at least slow, this unfortunate trend.

> The biggest headache with the newer rigs is the pushbutton power

I would think that a 555 might be a way to solve that, and with
8 pin micros available for little more than the cost of a 555,
you could always use that solution which most assuredly would
do any tricks you needed, and more, to turn on the rig.

> You might advise your newbie to hit the web or E%^& for a used
> DJ-C5 dualbander.

The new person was extremely fortunate to have a grant, and used
stuff from anywhere was absolutely forbidden (I brought up ebay).
I found a rig (will have to look up exactly what model) that had
an EPO, but it took a while, and the whole incident served to
show what is going on with the design of modern HTs.

Hank

Just to avoid any misunderstanding, I mean that many folks on this list do dive right in, without hesitation, to do various mods on rigs, cameras, batteries, etc.

The wording above seemed okay when written, but I can see there's a chance it might be misinterpreted.

Hi Hank,

Well, there was one comment that suggested that one should shun
any HT that didn't come with an external power jack installed. And
I can certainly understand the reluctance to crack open the case
of a perfectly good rig which is jam packed with SMT components;
to quote "Zen and the Art of Motorcycle Maintenance", this action,
like assembly of Japanese bicycle, "require great peace of mind."

But subject to that caveat, it's doable, especially if all one is
doing is replacing the supplied battery pack with one's own
electrical equivalent.

Has anybody tried to modify the battery back as an
external power connector. I saw 1 good example of a
guy who waited until his HT battery died, then cracked
open the battery case, and replaced the battery guts
with an external connector regulator, and power filter
caps. It fooled the HT into thinking the battery was
huge.

David,

That's a good way to handle the situation if you don't
have an EPC.

I've never done it, but I rescued a Kenwood TR-2600A
2 meter HT (very old) that was going to be thrown out in
the garbage which has the very thing you're describing,
except it's factory made. It allows this rig without
an EPC to run neatly from a cigarette lighter socket.

Hank

I did something similar with an Alinco DJ-190, except to the empty AA holder
came with it. I just wired up a connector to the terminals inside that.
The only problem was soldering to the (nickel?) plated stuff.

To solder Ni plate, first rough up the surface a little with coarse
sandpaper or a sharp knife, then apply some extra rosin flux and use
a 320C or 800F tip temperature to tin the surface before attaching
and soldering the wire. Real SnPb (60/40) solder works best.

I did it with my old Kenwood TH-215. In my case, I opened up the battery case, pulled the old batteries out, and soldered on a pigtail that I could plug into a 12 Volt gell cell. It works, and was a bit more reliable than the external power connector (If you've ever seen one of those short out, it can be rather spectacular!).

2335. D-STAR payload @ GPSL & Video Podcast

Yahoo group: GPSL (2002 — 2008)
Date: 2006-07-06 21:32:57 UTC
From: kc5zrq
Topic: 2335 Message: 2335

I plan on making the trip to GPSL this year. It will be my first time. I am hoping to send up a balloon containing a D-STAR radio, so I'm interested to know if anyone on the list owns a D-STAR digital radio.

I have also just started a video podcast related to APRS. The first episode features a balloon launch by the Amateur Radio Society at Tech (ARSAT), a group of Texas Tech students. You can view the video at http://www.aprstv.com . I'm interested in your feedback on the podcast.

Thanks
John, KC5ZRQ

2338. TINY TRANSPARENT BALLOONS PROBE STRATOSPHERE SECRETS

Yahoo group: GPSL (2002 — 2008)
Date: 2006-07-08 10:38:58 UTC
From: Ralph Wallio, W0RPK
Topic: 2338 Message: 2338
Attachments: 1 described; binary payloads are missing from this source WARC

From the July 4, 1936, issue

TINY TRANSPARENT BALLOONS PROBE STRATOSPHERE SECRETS

Shimmering bags of transparent material of the kind used in wrapping cigarette packages are the latest tools of science to tap stratosphere secrets. Soaring to altitudes of 20 miles, these small, unmanned balloons are being used to pierce the atmospheric heights far above where men can probe them with giant balloons carrying loads of equipment and human pilots. A vastly wider usefulness to science, research at only a fraction of the former cost, and complete freedom from any possibilities of loss of life are the three motives behind the gleaming balloons now being sent aloft which, through robot scientists in their "gondolas," record and send back to Earth the reports from near the "surface" of the sea of air that surrounds the planet Earth.

At the National Bureau of Standards in Washington, D.C., Dr. L.F. Curtiss has sent up such a balloon to an estimated height of over 100,000 feet. From such a height one could look down on the famed Explorer II as it broke the world's altitude record, 72,395 feet, as would the climbers of Mt. Everest on the ground 29,000 feet below.

And at the Franklin Institute's Bartol Research Foundation, Dr. Thomas H. Johnson is sending up similar balloons in studies with which it is hoped to close the last gaps in the mystery of science that has been the cosmic ray.

Zack,

Do you have an idea of how many groups are planning to attend and/or fly at GPSL this year?

I realized over the weekend that I've forgotten to make hotel reservations. Guess I'll have to see if there are any rooms remaining in the GPSL block.

Since it's about 3.5 weeks away, we should also begin thinking about frequency management issues.

So far I haven't had too many details of who is flying what. Please include the following:

1. Name of your group

2. Website for your group

3. Callsign(s) of your payload

4. A cellphone number that will be carried on the chase (for post-recovery coordination)

5. Number of transmitters and their band (specific frequencies only if you're rock-bound or don't wish to be time-slotted with others on the 144.34/39 freq).

6. Size of balloon

7. Approx number of helium tanks required (K or T)

8. Total flight weight

9. Expected ascent/descent rate

10. Projected burst altitude

11. Special requirements/requests for the GPSL coordinator

12. Short description of your payload including cameras, transmission modes, experiments, etc.

Hi Ralph,

Amazing! I thought that Otto Winzen was the creator of the plastic balloon sometime in the mid 1940's. I'm guessing that the film used 1936 was probably cellophane from the description in the article. I don't think polyethylene had been developed then, and mylar (polyester) certainly wasn't.

Hi Guys,

EOSS plans to fly a time-slottable APRS & digi on 144.34 plus a DF beacon on 145.600. All should be advised NOT to put beacon on 147.555 - that's the KS Skywarn simplex net freq - as we learned the hard way with our crossband repeater flying near Manhattan KS a few years ago. We also plan to fly ATV on 426.25 MHz. There may be some other goodies coming along as yet TBD - will coordinate.

GPSL 2006 ORB FLIGHT

1. Name of your group
Oklahoma Research Balloons

2. Website for your group
http://members.cox.net/hhm_74775/orb/

3. Callsign(s) of your payload
KC5TRB-11

4. A cellphone number ?????

5. Number of transmitters
APRS KC5TRB-11 (250mw) 144.340 (Can change/slot)
TRB FM/CW Beacon (12mw) 147.435 (Fixed)
Parott Repeater on 446.300 (Can change)

6. Size of balloon
850 grams

7. Approx number of helium tanks required (K or T)
NONE (will supply our own)

8. Total flight weight
4 pounds

9. Expected ascent/descent rate
1000 ft/min (UP)
1600 ft/min (DN)

10. Projected burst altitude
80,000 feet +

11. Special requirements/requests for the GPSL coordinator
I only anticipate myself and my son for support and would like to have some volunteers to help on the launch and chase & recovery. You should have mobile APRS tracking capability and DF equipment for the C&R.

12. Short description of your payloads
#1 - APRS KC5TRB-11 (250mw)
TRB FM/CW Beacon (12mw)
#2 - Parott Repeater
#3 - 2 Digital Pencams (hor/ver)

Harry - KC5TRB - Tulsa
Oklahoma Research Balloons

Toward the bottom, they mention the chloroprene balloons and say that 'technical data is available on request."

73 de Troy KC0MIC

Mark Conner <mconner1@...> wrote:
I ordered 3 1500g balloons from Scientific Sales this week - placed the order Sunday and received it today, so they're pretty quick on the shipping. The website says that shipping is extra for weather balloons, but I wasn't charged for it.

One thing I noticed is that the balloons are chloroprene rather than latex. Has anyone worked with chloroprene balloons before? They are supposed to be more light- and age-resistant than latex, but the handling information I've found on the web is contradictory. Some say chloroprene balloons are tougher, others say they need to be handled more carefully to prevent tearing.

I *think* these balloons are Totex, but they are labeled differently than what I've gotten from Kaymont previously. They are in a ziploc-style bag and the label on the box says they're made by "The Weather Balloon Manufacturing Company" of Tokyo, Japan.

Hi Troy,

Not sure about the difference of Chloroprene vs latex...however....I can answer the Japanese manufacturer question.

Kaymont distributes balloons manufactured by TOTEX in Japan.

Scientific Sales distributes balloons from "The Weather Balloon Manufacturing Company"...also from Japan...they are competitors with Totex.

This has been pretty much always been the case.....the two Japanese companies both manufacture using a similar process and in the past have both been natural latex, which deteriorates quicker in UV than synthetic latex which was the material used by the now out of business US based Kaysam balloon company.

It will be interesting to see how the Chloroprene balloons perform.

Hi Bill and all,

Chloroprene,, From what i knew a while ago,, it is a more stable form of rubber that is longer lasting than natural rubber (latex)

it resists the cold better,, and is also more UV resistant, i would be surprised if the Kaymont "Cold" weather balloons were not made of this material.

from a chem supplier I get,,

Chloroprene

ASTM D1418, ISO 1629 Designation: CR

ASTM D2000, SAE J200 Type/Class: BC, BE

Trade Names:
. Baypren? (Bayer Corp.)
. Neoprene? (DuPont Dow Elastomers)

Relative Cost: Moderate

General Temperature Range: -45? to +250? F

Chemically known as polychloroprene but often referred to by the trade name Neoprene?, chloroprene was one of the first synthetic materials developed as an oil-resistant substitute for natural rubber. Neoprene's molecular structure closely mirrors that of natural rubber, with the exception that a chlorine atom has replaced a methyl (CH3) sidegroup. Presence of a chlorine atom in each repeating unit increases the compound's polarity and improves its resistance to hydrocarbon fluids despite the presence of a double bond in the main chain. Because the chlorine atom essentially deactivates the double bond, chloroprene is more resistant to oxygen, ozone, and UV light than similarly unsaturated polymers.

Due to the similarity of their structures, natural rubber and chloroprene are generally comparable in their good strength, abrasion resistance, resilience, elongation, and strain crystallization characteristics. Both also offer a similar low fatigue property, low heat build up, low temperature flexibility, and high bondability. Chloroprene surpasses natural rubber in its resistance to aging, heat, oils, ozone, and solvents. Chloroprene has also gained FDA approval for use in the food and beverage industries.

CR performs well in:
. High aniline point petroleum oils

. Mild acids
. Refrigeration seals (resistance to Freon? and ammonia)
. Silicate ester lubricants
. Water

CR does not perform well in:
. Hydrocarbons (aromatic, chlorinated, nitro)
. Ketones (MEK, acetone)
. Phosphate ester fluids
. Strong oxidizing acids

I wonder if chloroprene is the technical term for the "synthetic latex"
that Totex uses? Natural latex is the light tan color that we've all
seen before.

Or is this something entirely new from Totex? If it's from Sci Sales,
then it probably not Totex but that other Japanese supplier H?? maybe?

Hi Mike,

According to Kaymont who distributes the Totex balloons...they are 100 percent Natural Latex.....the only company who made synthetic latex was Kaysam who is now out of business.

It's also my understanding that the standard weather balloons sold by Scientific Sales are also Natural Latex but is sold by a competitor to Totex called "The Weather Balloon Manufacturing Company"....however, their Chloroprene balloons may indeed be synthetic latex....but I can't say for sure about that.

2370. GPSL 2006 T-shirt Review

Yahoo group: GPSL (2002 — 2008)
Date: 2006-07-18 06:06:44 UTC
From: Rick von Glahn
Topic: 2354 Message: 2370

Ok, Zazzle is expensive compared to Café Press, no doubt. But ...

I ordered the shirt Mark designed with the customizable callsign. The order was placed on Friday, July 14, 2006 at 4:00 AM (yes early morning, not afternoon) and arrived USPS standard delivery on Monday, July 17th. So they're pretty speedy.

I got exactly what I thought I'd get optically, meaning the positioning of everything was exactly as illustrated online. I did some customizing by bumping up the size of the callsign a few notches which required me to fiddle a bit with the layout so it didn't overlap any of the other text. So, pretty much, they do a good job sending you an accurate reproduction of your layout.

I further customized the shirt by selecting a color other than white (yellow). I'm not a white tee fan.

Now for the good or bad news depending on how you like your tees printed. This design applies ink directly to the fabric. Personally, I really like this technique as it lets the fabric breath making for a cooler shirt that isn't a perspiration trap. However, since I picked the yellow fabric, the photo was skewed color wise. Frankly, I like it the way it is but to each his/her own.

The other common method of applying photographs and logos to fabric is to print them on appliqués that are ironed on to the fabric using heat activated glue. This method yields a more detailed photograph as there is more "material" to print to, whereas ink applied to fabric essentially takes on the weave of the fabric as its default resolution.

So, for those of you trying to decide on whether or not ...

73 -- Rick, NØKKZ

From: GPSL@yahoogroups.com [mailto:GPSL@yahoogroups.com] On Behalf Of Mark Conner
Sent: Thursday, July 13, 2006 9:29 PM
To: GPSL@yahoogroups.com
Subject: [GPSL] GPSL 2006 T-shirts

I've finally worked out a T-shirt design for this year. There are two versions you can work with:

http://www.zazzle.com/product/235431573856277946
<http://www.zazzle.com/product/235431573856277946>
This one does not have a callsign on it, and is intended for people who don't want a callsign or name on the shirt. It's pretty simple to order - you just select the color, size, and style of shirt and place your order.

http://www.zazzle.com/product/235295145894529154
The front of this shirt must be customized with your name and/or callsign, or you'll get one with N9XTN on it! Just select the Customize button, switch to the front view, then change the text from N9XTN to whatever you want.

Shirt prices vary from about $16.50 for a basic white L or XL T-shirt to around $23 for a 3XL premium shirt. Ladies shirts, pocket Ts, and polos are available too. Because of the color photo on the back, a white or gray shirt is recommended. The design is not optimized for the "dark" T-shirts.

To get a quantity discount and to save on shipping costs, group orders are encouraged.

If you have questions, just e-mail me.

73 de Mark N9XTN

Last year when I ordered two shirts from Zazzle, they accidently put my daughters name on both shirts. I double checked the order and my name was suppose to be on one shirt and my daughter's name on the other. I emailed this info to them, seems I couldn't find a phone number for them, and also told them that the event was coming up very soon. They told me to throw the original shirts away and promptly corrected my order by over nighting the corrected shirts to me at no additional shipping costs. I was able to attend GPSL 2005 with the right shirts after all. I was very impressed with that kind of service from them. I am still impressed with the quality of the shirts today. They are holding up well.

Mark,

>Do you know what method Cafe Press uses for shirts?

It depends on the item. I just ordered an EOSS "Golf" shirt from them, it only was available with a heat transfer. However, most of their newer stock will allow the vendor to set either direct printing or heat transfer when creating the original and they can even leave that choice up to the customer if they want.

Cafe Press is a bit less expensive but I haven't yet discovered a way to allow the customer to modify the design of merchandise. So, it would be impossible (or perhaps impractical would be more accurate) to add personalized information to a design (callsign). But I should note that it has been a year or perhaps two since I really looked into that. I wanted to be able to offer that option to the EOSS store customers.

Rick,

Do you know what method Cafe Press uses for shirts?

> So, pretty much, they (Zazzle) do a good job sending you an accurate reproduction of
> your layout.

This is true no matter what size of shirt you get. Last year I got a 2T t-shirt for my daughter and it was an accurately-scaled version of the larger shirts, and the print was quite readable even at that small scale.

Our original NSTAR shirts were this way. It's nice for photos because white comes out as white, rather than the shirt color. But it does not breathe at all, which is rather uncomfortable in the summer heat. They also start looking rather ugly after several washings as the media breaks down. The Zazzle shirts do fade a bit with washing, but still look decent.

Zazzle also has a newer printing method that uses white inks on dark-colored shirts for more accurate photo rendering. I have not tried them yet, and I'm not sure the current GPSL design is suitable for dark-shirt printing (have to have transparency stuff set properly).

From: mconner1@gmail.com
Topic: 2376 Message: 2376

While 12-day forecasts aren't often all that useful, what's out there now indicates it'll be extremely warm on GPSL weekend. Temps in the 100-105 range aren't out of the question. Correspondingly, a high-pressure ridge aloft will make the winds pretty light. Current track predictions, using nominal values and a burst at 95,000', show a landing about 30 miles WNW of the launch site.

Using GFSlr on READY and selecting 288 hours (1200 on Aug 5th) I get 14 miles, bearing 306 degrees (NW).

But as you said, a 12 day forecast isn't terribly useful.

2382. Chloroprene balloon report

Yahoo group: GPSL (2002 — 2008)
Date: 2006-07-24 19:07:21 UTC
From: mconner1@gmail.com
Topic: 2382 Message: 2382

We flew one of the 1500g chloroprene balloons from Scientific Sales last Saturday for the UNO BalloonSat flight. Neck load was approximately 11 lbs and total lift was 15-16 lbs based on gas used and what scale readings we could get in the light breeze.

The balloon neck was about 3" shorter than what we're used to seeing, and had more of a plastic feel to it. The balloon itself was also asymmetrical after filling it, like many of the Kaysams we've used in the past.

Performance was on par with a Kaymont/Totex 1500g. We got 92,720' out of it.

All things being equal, I'd rather use a Kaymont. I think their TX1000s do nearly as well as a 1500g balloon, and for about $75 rather than $125 for the SS 1500g.

From: Zack Clobes
Topic: 2390 Message: 2390

They're checking for sure, but it appears that there are several rooms still available at the Grand Prairie if you want to join the rest of the group, or if you haven't already made reservations.

As a re-cap, the hotel has:
* Indoor water park
* Wireless Internet
* Symposium will be held on-site
* Restaurant
* Video arcade
* Pop/candy machines
* Easy access (near the intersection of 11th and K-61)

Hi Mark,

What ascent/descent rates and burst altitude didja use? Looks like a
high burst could bring the landing site down into S. Hutch. Of course,
this is a very low confidence forecast, but not all that unusual for
a summer flight - although I don't recall having seen a "twisted Zorro"
flight before, either.

2393. GPSL Digi & Igate

Yahoo group: GPSL (2002 — 2008)
Date: 2006-07-25 17:12:33 UTC
From: Harry M
Topic: 2393 Message: 2393

I am using a TT-III and if I put 31 sec for a time-slot and read the config,
it reads 31
sec's, but when I put in anything over 31 sec and read the config the time
is " -65504 ".
If I had a time-slot of more than 31 sec, how is that accomplished?

What Digi Path will be best on 144.340 for stand-alone APRS?
Will there be an Igate?

Thanks!
Harry KC5TRB

Thanks Mark, I'll give 32 a try later!

Is it possible to have someone setup a radio to cross-freq from .34 to .39? I do that here in Tulsa when WW5WOW doesn't provide the Igate. Granted there are collisions, but not that many and it wouild only be for a couple hours. When WW5WOW provides the Igate he sets up UiView as an Igate just for our flight. It sure would be nice if someone would do that. There will be a lot of listeners watching for the flights.

Zack,

I've talked to some of the EOSS folks, and we heartily endorse Harry's request. An I-gate for the balloons on Sat. would be just great. If there isn't a cross-freq capability, perhaps one of the local I-gates could just switch over to 144.34 MHz during the flight. As Harry said should only need to do that for a couple of hours. Number of folks here in the Denver area (and two in Seattle) would very much like to monitor the GPSL flights via the Internet.

Thank you.

TT Slot-Time

I have "Auto Xmit Delay" set to 500ms and "Quiet Time"
set to 526ms. I changed the slot value to 35 and it
beacons at 3 and 33. Set the Slot to 31 and it beacons
at 32 only. I got the latest GUI and get the same results.
Looks like 31 is the max it will allow.

Space Bulletin 005 ARLS005
From ARRL Headquarters
Newington, CT July 27, 2006
To all radio amateurs

SB SPACE ARL ARLS005
ARLS005 Massive CubeSat launch fails

An attempt to launch 15 CubeSats from 11 universities and one private company failed July 26. Fourteen of the CubeSats, now lost, carried Amateur Radio transmit-only payloads.

The Dnepr-1LV rocket lifted off from Russia's Baikonur Cosmodrome in Kazakhstan at 1943 UTC on July 26. Space Launch Report cites payload users as reporting that the mission went awry sometime after first-stage separation. An Interfax, report said an emergency shutdown of the rocket's main engine initiated 86 seconds after launch, shortly before the first stage would have completed its burn. Gazeta.kz reported the vehicle fell to Earth almost 190 km from the launch site.

Originally set for June 28, the launch had been postponed until July 26. The CubeSat project was a collaboration between California Polytechnic State University-San Luis Obispo and Stanford University's Space Systems Development Laboratory. All of the CubeSats were designed and built by students at various universities in the US and elsewhere in the world.

Thirteen of the satellites were to have downlinks in the Amateur Radio satellite allocation between 435 and 438 MHz, and one was to operate on 145.980 MHz. None of the spacecraft carried a transponder. Transmitter power outputs ranged from 10 mW to 2 W.

According to Satellite Launch Report, the original Dnepr launcher was replaced by a different one in June after a problem was detected in the original vehicle's digital flight control system. The Dnepr vehicle is a repurposed SS-18 "Satan" three-stage intercontinental ballistic missile.

Date: 2006-07-28 17:22:15 UTC
From: mconner1@gmail.com
Topic: 2414 Message: 2414

The longer-range models have changed their tune on the weather around Hutchinson late next week. Instead of being very hot, a nice break is expected around mid-week. A relatively wet period is expected from Wednesday to Friday, with cooler air finally pushing the rain to the south later Friday. Saturday morning should be near or slightly below seasonable temperatures (60s) with surface winds from the east at 5-10 mph.

Latest track forecast indicates most flights will end up southeast of the launch site about 20 miles distant.

2423. CubeSats lost in Dnepr 1LV rocket abort

Yahoo group: GPSL (2002 — 2008)
Date: 2006-07-30 03:57:51 UTC
From: Mike Manes
Topic: 2423 Message: 2423

Hi,

The following clip from the ARRL Letter V25/#30 of 7/28 illustrates why high altitude balloons are gaining favor for student satellites. It's likely that at least one of these cubesats had been tested on an ARHAB flight.

73 de Mike W5VSI, EOSS

--- clip ---

==>MASSIVE CUBESAT LAUNCH FAILS

A much-heralded attempt to launch 15 CubeSats built by 11 universities and one private company failed this week. Fourteen of the tiny spacecraft carried Amateur Radio transmit-only payloads.

The Dnepr-1LV rocket lifted off from Russia's Baikonur Cosmodrome in Kazakhstan at 1943 UTC on July 26. Various accounts indicate that the mission went awry less than two minutes after liftoff when the first stage failed to separate on time, causing an emergency shutdown of the rocket's main engine. Reports vary on how far downrange -- and just where -- the vehicle fell. One said the Dnepr dropped to Earth some 15 km from the launch site, while another put the distance at 190 km. A third account said the Dnepr dropped into the Indian Ocean.

Originally set for June 28, the launch had been postponed until July 26. The CubeSat project was a collaboration between California Polytechnic State University-San Luis Obispo and Stanford University's Space Systems Development Laboratory. All of the CubeSats were designed and built by students at various universities in the US and elsewhere in the world. The CubeSat roster included AeroCube-1, CP-1, CP-2, ICE Cube-1, ICE Cube-2, ION, HAUSAT-1, KUTESat, MEROPE, nCube-1, RINCON, SACRED, SEEDS, PiCPoT and Voyager.

Thirteen of the satellites were to have downlinks in the Amateur Radio satellite allocation between 435 and 438 MHz, and one was to operate on 145.980 MHz. None of the spacecraft carried a transponder. Transmitter power outputs ranged from 10 mW to 2 W.

The Dnepr was the second to launch this month from Baikonur's Area 109. Other payloads included BelKA, the first Belarusian satellite, and three other microsatellites. According to Satellite Launch Report, the original Dnepr launcher was replaced by a different one in June after a problem was detected in the original vehicle's digital flight control system.

The Dnepr launch failure was said to be the first in seven orbital launch attempts. The Dnepr vehicle is a repurposed SS-18 "Satan" three-stage intercontinental ballistic missile, originally designed in the 1980s to compete with the US Peacekeeper missile. The START 2 treaty allowed up to 150 of the missiles to be converted for use as space launchers.

The Russian space agency has convened a special commission to look into the cause of the malfunction.

Harry, we have got to stop meeting in these corn fields. Especially if there is over six inches of mud in the corn rows. Once was enough. I not only have new socks but the old ones that I didn't loose last time, I have washed them and they are clean and ready to go. I am also bringing the same boots. Keep it from raining at least. "NO RAIN AFTER WEDNESDAY", right, knowing the midwest that could be a problem. What we have to do is convince Mark with Helo 1 to come one of these years and suspend you from the chopper to pick up the payloads without touching the gound. That involkes a pretty picture, doesn't it?
Harry, you should have been on EOSS 109 and 110. We just flew them yesterday. Boy, did we land in some rough country. You wouldn't think that the priarie would have four wheel roads, but we sure did yesterday. Pictures on the www.eoss.org web page soon. The group here is planning on leaving on Thursday morning, August 3rd around 7:00 am and arriving in the Hutch area around 3:00 to 4:30 pm, depending on the Kansas highway pratrol. Larry Noble, won't be with us this year, so no "Reciprocity" tickets are available. The full force of the law will be apon us. See you at the hotel Harry on Thursday afternoon. We all plan to attend the dinner Thursday night. There are at least five confirmed vehicle/teams going from Denver and and John and wife from Texas. See everyone soon. Benjie W0CBH.

Hi Benji,

Well, here's what the NWS says for Hutch right now (Sun).
We can deal with the mud. At least the temp's will be below what they were last week!

Wednesday Night: A slight chance of showers and thunderstorms. Partly cloudy, with a low around 68.
Thursday: A slight chance of showers and thunderstorms. Partly cloudy, with a high near 90.
Thursday Night: Partly cloudy, with a low around 68.
Friday: Partly cloudy, with a high near 91.
Friday Night: Partly cloudy, with a low around 71.
Saturday: Partly cloudy, with a high near 94.

I hope you all have a great trip from Co. FLY LOW!
I will be leaving here around 1pm Thur. Will arrive
Hutch between 4-5pm. I will have APRS running.

See you all at the hotel and dinner.

73 Harry

Zack,

I was just looking at the Grand Prairie's website...
What happened to Houlihan's? Did it get replace by the Grand Slam Sports Cafe?

Rog - KC0MWM

Yes, Houlihan's is no more, but I checked out the Grand Slam Sports Bar & Grill tonight, and other than some first-night rough edges, they were in pretty good shape. The food is just as good (albeit maybe not quite as fancy), but seems to be cheaper.

Unfortunately, they still have Coke products.

2430. Conference Proceedings

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-02 02:20:46 UTC
From: Scott
Topic: 2430 Message: 2430

Is anybody thinking about assembling the slide presentations /
handouts etc and posting them to the Yahoo group or burning them to CD ?

I'd love to sit in on these discussions but the work schedule doesn't
seem to be cooperating.

It would be nice to get ahold of the "proceedings" and stay in the
loop on balloong developments. I'm speaking for myself here, but I
think a CD would be something folks would pay a nominal fee for.
Sorta like how AMSAT or Project SETI maintains documentation of their
git-togethers.

2435. GPSL2006 packets received near Des Moines

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-05 16:08:49 UTC
From: Ralph Wallio, W0RPK
Topic: 2435 Message: 2435

```
Multiple packets received from W0NSV-11 and AE0SS-11. None from other payloads.
Direct reception only - digipeated packets have been removed.
Line-of-sight distance roughly 325mi.
Lowest altitude for a received packet: 73kft for W0NSV-11 79kft for AE0SS-11.
(Note shorter packet received 1-min earlier from AE0SS-11.)

From: Zack Clobes
Topic: 2436 Message: 2439

Thanks. I hadn't been able to get in touch with Paul to verify his success.

All-in-all, I think everything went well this weekend. Friday's conference was packed full of good presentations, and insightful dialog. I hope to recap some of this on the website and/or CD.

Bill Brown was a little late in getting off the ground due to some GPS issues, but got them running. Everyone else lifted off pretty much on schedule in one of the two groups of balloons.

Come to think of it, I don't even remember anyone reporting even partial equipment failures, other than some strange RF noise apparently coming from one of the balloons.

Lunch on Saturday wound up taking place at a Methodist church in Geneseo. Apparently the town had geared up for hundreds (thousands?) of motorcycles to come through and the church had cooked food for about 300. When we asked some land owners for permission getting onto land, one of the ladies said that they'd only seen about 40 come through, and that we were welcome to join them for lunch.

Saturday evening most of the remaining participants had dinner at Lone Star where the war storied continued.

One of the waitresses was having problems taking our orders because we were all deeply engrossed in the various conversations. She remarked that normally taking people's orders isn't a problem because no one's really talking and/or listening to each other... I thought that was an interesting (but sad) observation.

Just a quick note to say thanks to Zack for a great job putting GPSL together. I enjoyed visiting with old friends and meeting new ones. The seminars were very entertaining and contained lots of good information. Congratulations to
all who flew and the support personnel which helped make for all the successes.

I would like to request that anyone who has an APRS log of 144.340, please send it to me. With all the interference that was on .34 I have many holes in my log as I'm sure everyone else does. The more logs I have the better chance of reconstructing my flight. I sent my log to Nick (N0LP) and If you would like mine please let me know!.

Looking forward to GPSL 2007!

I'd like to echo Harry's comments.

Thanks to Zack! We had a great time. Visited old friends and made new ones.

I've attached my TNC log. It has a couple of holes in it also. The findu trail seems to have gotten most of the packets, but it had 2 holes it it also.

Hi Rick,

Hey, thanks for the P1 pix from the AE0SS ATV module on EOSS-111.
I'll compress 'em down to dial-up file size and pass 'em on to
the rest of the group.

We were running a KPA-5 1W PEP AM DSB xmtr to a W6AOL Little Wheel
(H-pol omni). At peak altitude (about 90,000 ft MSL), we were about 10 mi
NNE of Lyons KS. Not bad ATV DX, eh? Looks like you got pre-burst
image of balloon, and a post-burst image of the parachute, both
looking up from from the ATV module.

BTW, we were getting some crosshatch QRM from a nearby balloon with
a carrier in band. So you probably were having the same problems we
were, despite an otherwise P5 image thruout the flight.

Any idea of the distance from Norman?

BTW, Bill Brown WB8ELK was also running ATV on 439.25. Get any images
from his payload?

2454. [GPSL] Re: Quick GPSL report

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-09 17:41:56 UTC
From: PAUL VERHAGE
Topic: 2436 Message: 2454

We were there to see it land. I stayed at the airport for an hour before leaving. I copied to video from the flight to Dan. I'm editing it down now, its over 800 MB in size. I have video of the potato chip bag bursting, along with the balloons. The change in the sound of the audio beacon is interesting. I have spectrogram software in my radio show editing software that I'll try using on it.

The flight in Klammath Falls was launched before OIT realized the GPS wasn't locking. So we tracked the capsules on a bird tracker on the parachute. We got a bunch of false leads before getting a phone call from a family that found the capsules in a tree inside the boundary of Crater Lake NP. That's a pretty place (all of the Cascades appear to be). The caller used his cell phone, so we couldn't get hold of him again. So I suggested we drive to Crater Lake (we were about 10 miles away) and try tracking him down with the bird tracker. As soon as we drove through the ranger station I turned the radio back on and got a powerful signal. He was only about 500 feet away on the parking lot.

Paul

>>> "Mark" <mconner1@...> 8/6/2006 9:22:09 am >>>

Dan KE4SLC wrote me that Paul recovered his OK too - they were in
position to watch it land. So it sounds like it was 100% for the day.

Greetings gents,
I set my home station to track & IGate the GPSL action on 144.34Mhz. I
logged all raw RF data, the rf-to-internet and internet-to-rf traffic in
separate files. There is some "normal" aprs tcpip data mixed with the
flight telemetry (someday I'll figure out how to filter that during flights
- I want to see flight-related traffic from the aprs servers, but not qth
reports from other areas).
It was a good-looking flight from my vantage point in Bellevue NE :-)
73,

From: Harry M
Topic: 2464 Message: 2464

I have uploaded the ORB-21 post flight web page.

I haven't included any pics other than those pertaining to ORB because of space constraints. I might have room for a few, but it will be a while before I get to them.

Thanks Gene, I am now phase-locked with reality. The Adler FAR HORIZONS-1 flight has been in our
Launch Announcements since 18Jul. I received an announcement e-mail from Geza on 17Jul with details
that are posted. Please advise me of additional downlink modes and frequencies when decisions are
made.

I forwarded the announcement to Mark Garrett, KA9SZX (ma-garrett@...), who then corresponded
directly with Geza and was invited to participate.

2468. EOSS data posted

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-10 19:50:55 UTC
From: Rick von Glahn
Topic: 2445 Message: 2468

GPSL 2006 was another fantastic and fun event. Thanks to Zach for all his hard work getting the event organized.

I've started working on EOSS's recap page. Of interest to this group, there is an APRS log file we captured during the flights from our mobile ground station (my car!).

http://www.eoss.org/ansrecap/ar_130/recap111.htm

I also captured the findu.com logs with timestamps for all groups. I've posted them for historical purposes after all each flight team has probably already got them so it isn't of such immediate interest.

No pictures yet. We have hundreds of them so the problem isn't a lack of photographic documentation but way too much. I'll be running through the photos to pull out the best for adding to the website.

We have video from the ATV module. It varies between p0 and p5 mostly in the p2 to 3 range. But thanks to our mobile ATV capture machine (KB0YRZ's truck antenna array) the video is excellent at launch and pretty much p4 towards the end of the flight. I plan to extract the best 5 to 10 minutes and make something available on the net at that recap page above.

During our last flight at the end of July one of the student payload experiments failed. We flew that again for them at GPSL and their data file is available for your perusal. I extracted the charts and posted them on their own page.

So, the recap page is still fairly preliminary, but data is what most of you are all about so I thought I'd let you know ours is now posted.

As I understand the patent laws, unless devices are offered for
sale, no violation or "infringement" would occur anyway.

Hi All,

Hope everyone has recovered well.

A Question for all.

The small Clock oscillators,, ya know the small metal cans with usually 4 legs that ran on 5 vdc and had horrible square wave outputs,, but made great beacons due to some falling into the ham bands like the old standby 28.322MHz,

ya know they look like this

What's a good source for small quantity of them now days.

Thanks

Joe WB9SBD

Many options, including ECS -

http://www.mouser.com/catalog/627/720.pdf

Look for P/N 520-TCF2832-X in a full size package

520-TCH2832-X in a 8-pin DIP package

Fox lets you select any frequency less than 125 MHz for less than $20 in
single qty:

http://www.mouser.com/catalog/627/723.pdf

And finally, Abracon has a some surface mounts in that frequency:

http://www.mouser.com/catalog/627/703.pdf

Hi Joe,

Well, you won't find 'em at Rat Shack any more :={. Try DigiKey, Jameco
or Mouser. They all carry 'em. But hurry! Thru hole IC's are rapidly
being replaced by SMT devices; get binocular magnifiers and a real tiny
soldering iron tip!

Hi Troy,

One of the requirements for getting a patent is originality. Apparently,
the USPTO examiner who approved this patent app hadn't done much homework.
It happens far more often than one might expect.

But you are right - no one's gonna come after an ARHAB group with an
infringement suit - the ante is at least $500,000 - 15 years ago.

I made it back in time. The tracker OIT launched didn't get a fix, so it reported just the location of the campus constantly. That's a problem with relying on mapping software to look at tracker output rather than looking at the raw GPS data.

So the short of it is that we chased this thing down with a bird tracker and recovered it in the parking lot of Crater Lake National Park.

It's a digital camera with 2 megapixels. I was a no-name brand from Walmart that I purchased several years ago. I'll see if I can find the camera name after I get home. I an taking a trip to the Adler planetarium to help them with their first balloon launch, so it's going to be another week before I can email you the camera name.

Pretty much any digital camera should work. I'm soldering wires to the camera's shutter button so a flight computer can operate it. I'm also using a SDRAM card to save images instead of the camera's built in memory.

We've tried 4 different cameras and the best results have been with a cheapo 1.3 mp camera. But you can't make good posters with that resolution.

Your pictures seem MUCH more crisp, bright and in-focus that most of ours. I just wonder if it's because you have something to focus on in the foreground and the autofocus is less confused because of that. (dunno)

Additionally, I'm trying to find a camera that we can reliably acquire for reasonably cheap that we can use to put on 2 workshops.

The guy at Colorado, pre-modify them (a good idea) but they're using Canon Elph LT ASP film cameras. I don't know if they collecteyd a number of them over the years and use them over and over? If the don't, I wonder where they get them? They're hard to find on e-bay, though pretty cheap.

Another question about workshops. Do the teams take the airframes home after the flight? They don't pay for the HOBO or camera do they? Do you just use them over again? What do you ususally charge for the workshop to cover the materials?

Thanks!

Troy

PAUL VERHAGE <paul.verhage@...> wrote: It's a digital camera with 2 megapixels. I was a no-name brand from
Walmart that I purchased several years ago. I'll see if I can find the

planetarium to help them with their first balloon launch, so it's going
to be another week before I can email you the camera name.

Pretty much any digital camera should work. I'm soldering wires to the
camera's shutter button so a flight computer can operate it. I'm also
using a SDRAM card to save images instead of the camera's built in
memory.

I've used a 1.3 mp no name that I got from a camera store, a 2.0 Vivitar mp from Walmart, a Concord 4060af from ebay and we're currently using a 3.2 mp HP.

The no name gave us the most consistantly clear pictures but we wanted to get higher density images. The Vivitar made good pictures but fell to pieces on it's first mission. The Concord has flown a couple of times but gave us the most consistantly _bad_ pictures (rarely in focus). The HP is a happy medium but the the silly thing only takes 128mb SD cards. We discovered on the first flight that if you put a 256mb card in it, it will take pictures up to 128mb and then reformat the SD card..... Bummer.

The Concord is about the easiest to modify, so for the workshops, I guess I'll start buying them up when I find them on e-bay. They're pretty cheap right now. Load them up with 512mb or 1gb SD cards and it's bound to come up with a few good pics.

On another front, I've got a couple of the 1gb Aiptek 5400 DVRs, but they take pretty good pictures as well as movies. A couple of servers and I can get it to do both..... Maybe.

Troy

mconner1@... wrote:
I've had good luck with the Concord 4060AF, which is a 4MP camera. In my opinion, the 4MP is done with oversampling and software - the effective resolution is probably about 2MP. I got it at GPSL 2004 from the Wal-Mart we took our film to.
I used to use a Canon Elph LT as well, and still have it. It produced pretty sharp pictures as long as the payload was stable. But you only got 40 of them.
In my view, the key to getting good photos is to shoot a bunch. With a 512 MB card, I can shoot a 4MP picture every 30 seconds and have room to spare. While you have to wade through 200-300 pix, you're bound to find a few to make you say "wow" on each flight. Only shooting 40, you're lucky you get one really great one.
Wal-Mart has a couple of no-name digital cameras in blister packs for a reasonable price. There's a 2MP camera for around $35 that has no display on it, and a 3 or 4 MP camera for about $45 that does have a display. Obviously the lack of display is no big deal for this. I have no experience with these cameras, though. The Elphs run >$100 new.

Thanks for the info Mike.

I figured it had to be something like that. I guess I'll start collecting some cameras. I like the Elphs but I'm going to try to decide on some particular model of digital camera. I might start writing letters to some companies and see what I can get.

I'm getting away from film cameras these days. A film camera is so limited with the number of expsoures that you're bound to miss some good images. If you can get a camera with a setting to take landscape pictures, use that. My regular camera has a lens that you can snap into one of two positions, portait and landscape. The digital camera from this flight didn't have a setting like that, so it may be preset for infinity.

I let my students take their airframes, but not the avionics. The BalloonSat calsses I do are with groups that provide their cameras and Hobos. I've made some camera timers and donated them, though.

Paul

2507. Re: [GPSL] Congratulations! QHA antenna for ATV-SSTV and TARS?

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-16 03:42:52 UTC
From: dmarroneny
Topic: 2487 Message: 2507

Congratulations!

As a new member, I had hoped to participate in GPSL 2006, but unfortunately I could not rally the funds in time. Instead, I have been monitoring your progress and success from this forum. Thank you for sharing your wonderful photos and videos, they are truly inspirational.

I've read your draft book (Parallax site), and EOSS "how to" ARHAB docs, and sucessfully launched a demonstration "Early Warning Weather BalloonSAT" which performed Data Telemetry on 70cM (433Mhz) of: temp, pressure, rainfall, and a 170-parameters total, for the Amateur Radio & Relay League (ARRL) Field Day 2006 Event hosted by my distance learning school: www.Jvril-Science.com , and the New York Hall of Science Amateur Radio Club (www.HoSARC.org). Thank you for your help, it would not have been possible without your instruction.

Tech Question: Has anyone ever considered using a Quadrifilar Helix Antenna(QHA) on 2M or 70cM, for ARHAB ATV-SSTV or TARS?

A half-turn, half-wavelength QHA antenna offers a gain of 5-dbi and 3-db wide beamwidth of 115 to 140 degrees, and allows for data collection down to 10-degrees of the horizon. In addition, it is compact in size (24-inches in length), very low cost, and takes only minutes to assemble.

The QHA antenna is often used to receive SSTV images from overhead passing weather satellites. Perhaps, its increased gain and wide beamwidth would offer an advantage to ARHAB ATV-SSTV? Likewise, its wide directional beamwidth, and increased gain could also provide an advantage to ground tracking and recovery system (TARS)crews in their pursuit of descending ARHAB Balloon SATs?

Hello Troy,

I will scan the docs, and send them to you in the next day or two.

Did you participate onsite in GPSL? Did you design and launch your own ARHAB?, or were you part of the TARS team?

I am one of three teachers at NY Hall of Science Amateur Radio Club (HoSARC), and we are in the process of putting togeher a demonstration unit to perform APRS, via amateur radio tied to GPS, and TNC to laptop PC.

I've purchased the Byonics TNC3+, and will be interfacing it to a Garmin eTREX Legend-C GPS, and ICOM IC-T90A (Tribander; 2M, 70cM, and 6M). In hopes of improving ATV-SSTV and TARS, my research has pointed me towrds the QHA antenna.

After receiving the QHA docs for fabrication, I do hope you will decide to actually build this antenna. It would be great to exchange information on our findings.

dmarroneny <dmarroneny@...> wrote: Congratulations!

As a new member, I had hoped to participate in GPSL 2006, but unfortunately I could not rally the funds in time. Instead, I have been monitoring your progress and success from this forum. Thank you for sharing your wonderful photos and videos, they are truly inspirational.

I've read your draft book (Parallax site), and EOSS "how to" ARHAB docs, and sucessfully launched a demonstration "Early Warning Weather BalloonSAT" which performed Data Telemetry on 70cM (433Mhz) of: temp, pressure, rainfall, and a 170-parameters total, for the Amateur Radio & Relay League (ARRL) Field Day 2006 Event hosted by my distance learning school: www.Jvril-Science.com , and the New York Hall of Science Amateur Radio Club (www.HoSARC.org). Thank you for your help, it would not have been possible without your instruction.

Tech Question: Has anyone ever considered using a Quadrifilar Helix Antenna(QHA) on 2M or 70cM, for ARHAB ATV-SSTV or TARS?

A half-turn, half-wavelength QHA antenna offers a gain of 5-dbi and 3-db wide beamwidth of 115 to 140 degrees, and allows for data collection down to 10-degrees of the horizon. In addition, it is compact in size (24-inches in length), very low cost, and takes only minutes to assemble.

The QHA antenna is often used to receive SSTV images from overhead passing weather satellites. Perhaps, its increased gain and wide beamwidth would offer an advantage to ARHAB ATV-SSTV? Likewise, its wide directional beamwidth, and increased gain could also provide an advantage to ground tracking and recovery system (TARS)crews in their pursuit of descending ARHAB Balloon SATs?

Now this is truly amazing:

Balloon folks who have August 15th as their birthday:

Bill WB8ELK
Joe WB9SBD
Chuck W9IH (former WB9IHS)
Troy KC0MIC (and his Dad too !!)
Hap WZ4O

Hap and I are also big into ATV

How many others in the ballooning community with Aug. 15th birthdays I wonder?

- Bill WB8ELK

Happy Birthday to all of the above and to those I don't know about yet.

There's probably pulsar somewhere in the constellation LEO who's period peaks every 12 months on Aug 15. That radiation has some special effect on the developing minds of certain newborns. And isn't it strange the LEO just happens to stand for "Low Earth Orbit" ?

Maybe we ought to declare 15-August National Near Space day and have coordinated luanches on that day.

2520. Re: Follow-up to QHA antenna for ATV-SSTV and TARS?

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-17 01:45:43 UTC
From: Dominick J. Marrone
Topic: 2487 Message: 2520

Hello David,

You are correct, Garmin eTRex Legend-C is a USB GPS, and it comes with an eTrex mini-USB to USB cable. A custom cable is unavoidable, I am waiting reply from PFranc.com 'Custom Cables' for verification of cable pinout, voltage levels, and hookup.

At present, I am curently using a USB2COM DB-9 Serial cable (Dynex DX-UBDB9 from Best Buy P/N#7135664 for $35.99) which interfaces nicely between my LaCross Weather Station and my Toshiba Satellite Laptop (this cable comes with USB2COM drivers, and installs in seconds).

I believe it might be possible to use this USB2COM cable for the eTREX too (with the addition of a 3-USB (female)to 1-USB (male) Hub connector (no external power suppply needed). My real concern is not physical conncetors, as they can be easily removed and substituted, but that the voltage pin from TNC3+ to eTREX does not exceed 3.5 volts! My eTREX Legend-C (color display) is the new model; blue case, but on the earlier model; yellow case (ver3.0) you could not exceed 3.5V at 360ma, and at 5V the screen would go completely dark!

So far, all the docs/specs I've read, indicate that my model too is limited to 3.5 volts or less! As for the other pins; data in (RD) pin2, data out (TD) pin3, and signal ground (SG) pin5, they should all remain compatible with standard COM port (RS232 DB-9 pinout).

I'm also following-up with Byon, at Byonics, for possible solution. Since my application is ARHAB weather meteorology, I'm also looking into Byonics new "WXtrak", which acts as a normal TNC3+/APRS interface, but can be used specifically for weather data APRS packets, including location and direction (may require some custom programming).

When I have confirmed the USB2COM cable for eTREX Legend-C interface to Byonics TNC3+, I can send you the interface cable data pinout -- if you're interested?

P.S. I once worked as a summer counselor assistant (woodshop) to a David Hoffman at Ocean Beach Youth Group (OBYG) in L.I. New York, circa 1977 or 1978. At the time, David was also into scuba-diving! Are you this person? If so, it is great to hear from you again!

2521. Re: Follow-up to QHA antenna for ATV-SSTV and TARS?

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-17 01:46:16 UTC
From: Dominick J. Marrone
Topic: 2487 Message: 2521

Hello David,

You are correct, Garmin eTRex Legend-C is a USB GPS, and it comes with an eTrex mini-USB to USB cable. A custom cable is unavoidable, I am waiting reply from PFranc.com 'Custom Cables' for verification of cable pinout, voltage levels, and hookup.

At present, I am curently using a USB2COM DB-9 Serial cable (Dynex DX-UBDB9 from Best Buy P/N#7135664 for $35.99) which interfaces nicely between my LaCross Weather Station and my Toshiba Satellite Laptop (this cable comes with USB2COM drivers, and installs in seconds).

I believe it might be possible to use this USB2COM cable for the eTREX too (with the addition of a 3-USB (female)to 1-USB (male) Hub connector (no external power suppply needed). My real concern is not physical conncetors, as they can be easily removed and substituted, but that the voltage pin from TNC3+ to eTREX does not exceed 3.5 volts! My eTREX Legend-C (color display) is the new model; blue case, but on the earlier model; yellow case (ver3.0) you could not exceed 3.5V at 360ma, and at 5V the screen would go completely dark!

So far, all the docs/specs I've read, indicate that my model too is limited to 3.5 volts or less! As for the other pins; data in (RD) pin2, data out (TD) pin3, and signal ground (SG) pin5, they should all remain compatible with standard COM port (RS232 DB-9 pinout).

I'm also following-up with Byon, at Byonics, for possible solution. Since my application is ARHAB weather meteorology, I'm also looking into Byonics new "WXtrak", which acts as a normal TNC3+/APRS interface, but can be used specifically for weather data APRS packets, including location and direction (may require some custom programming).

When I have confirmed the USB2COM cable for eTREX Legend-C interface to Byonics TNC3+, I can send you the interface cable data pinout -- if you're interested?

P.S. I once worked as a summer counselor assistant (woodshop) to a David Hoffman at Ocean Beach Youth Group (OBYG) in L.I. New York, circa 1977 or 1978. At the time, David was also into scuba-diving! Are you this person? If so, it is great to hear from you again!

2522. August 15th 2007 will be the 20th anniversary balloon flight celebration bash

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-17 05:07:09 UTC
From: wb8elk@aol.com
Topic: 2499 Message: 2522

> Maybe we ought to declare 15-August National Near Space day and have coordinated launches on that day. - Troy

Next year I plan to hold a 20th anniversary balloon celebration in Findlay, Ohio near August 15th, either the weekend before or after and to include a special flight on the actual day.

All are invited to watch or launch and I hope as many of the Aug. 15th balloon folks can attend as well.

This will be something of a Midwest version of GPSL.

See you next year - Bill WB8ELK

As a new member, I had hoped to participate in GPSL 2006, but unfortunately I could not rally the funds in time. Instead, I have been monitoring your progress and success from this forum. Thank you for sharing your wonderful photos and videos, they are truly inspirational.

I've read your draft book (Parallax site), and EOSS "how to" ARHAB docs, and sucessfully launched a demonstration "Early Warning Weather BalloonSAT" which performed Data Telemetry on 70cM (433Mhz) of: temp, pressure, rainfall, and a 170-parameters total, for the Amateur Radio & Relay League (ARRL) Field Day 2006 Event hosted by my distance learning school: www.Jvril-Science.com , and the New York Hall of Science Amateur Radio Club (www.HoSARC.org). Thank you for your help, it would not have been possible without your instruction.

Tech Question: Has anyone ever considered using a Quadrifilar Helix Antenna(QHA) on 2M or 70cM, for ARHAB ATV-SSTV or TARS?

A half-turn, half-wavelength QHA antenna offers a gain of 5-dbi and 3-db wide beamwidth of 115 to 140 degrees, and allows for data collection down to 10-degrees of the horizon. In addition, it is compact in size (24-inches in length), very low cost, and takes only minutes to assemble.

The QHA antenna is often used to receive SSTV images from overhead passing weather satellites. Perhaps, its increased gain and wide

beamwidth would offer an advantage to ARHAB ATV-SSTV? Likewise, its wide directional beamwidth, and increased gain could also provide an advantage to ground tracking and recovery system (TARS)crews in their pursuit of descending ARHAB Balloon SATs?

I agree witrh Mark about the digital cameras (in fact I'm writing that into my next column). You're better off with a digital camera and lots of memory. You'll have 200 pictures to go though, but something is bound to turn up. I doubt I would have gottent he potato chips picture if it had been taken with my Elph.

By the way, I'm grabbing a bite in Omaha before getting back on the road. I drove past Grand Isalnd about 2 hours ago.

Paul "I can't wait to get back on the roads again" Verhage

Thanks for the info Mike.

I figured it had to be something like that. I guess I'll start collecting some cameras. I like the Elphs but I'm going to try to decide on some particular model of digital camera. I might start writing letters to some companies and see what I can get.

Funny you should mention that. We've got NSTAR, NearSpace Ventures, CAPnSPACE, HABITET Skylab, CNNSP, KCATV and a student group in Lawrence KS all pretty close by. I was thinking of aranging a Midwest GPSL sometime if it didn't conflict with GPSL.

Maybe instead of a formal "gathering in one place" we could coordinate launches.

Maybe not.

Mark,

You'd said in an earlier email that you were using DataTrak code in a new PIC and installed on a TinyTrak III.

What kind of details can you give on that? Is there a manual for it? Do you just send data with it? In other words do you have to parse the GPS and format an APRS string in the flight computer ? If you do, what do you use for a MPU? I'd think that an BS-2 would be a bit under powered.

I'd really like to get some more functionallity for data transmission without having to use a KPC-3 and this sounds like it should do the trick. But if the BS-2 is going to have to parse the GPS strings and format an APRS string, then there won't be much space left for it to do anything else.

Hi Mark,

I just got through testing an OT-PSK combined with my modified 12mw CW beacon. It works great on 2m FM and if the GPS is omitted It sends short messages along with Batt-V & temp. Makes a great PSK beacon! It might be on my next flight. Not having the capablity to program PIC's, the OT was convenient.

Are we on the same track or what! :~)

Friday, August 18th, 2006

Hello Paul Verhage,

I am a new forum member of TV-NSP, and had hoped to participate in GPSL 2006 but could not secure funding in time. Briefly, I am an Aerospace Engineer, ARRL Registered Volunteer Instructor at the New York Hall of Science Amateur Radio Club (HoSARC.org), and the founder of: Jules Verne Research Institute of Life Science (Astrobiology), an new online distance learning center at: www.jvril-science.com.

I have a method of extending ARHAB flight-time at Near Space altitudes, both before and after Balloon Burst, using an Electric Ion Propulsion Powerplant.

I am an experienced designer and builder of small scale Electric-Gravitic Propulsion Powerplants (a.ka. Electric Ion Propulsion or EP) which are capable of producing an upward thrust greater than the downward force of gravity, causing levitation or a lifting effect. As an EP designer, I build and integrate EP powerplants into small scale micro reusable launch vehicles (mRLV's). The unique aspect of these EP Powerplants is that they only use electricity to impart motion, and DO NOT use solid or liquid fuel propellants, ordnance, propellers, fans or blowers, to produce levitation (lifting thrust).
I assure you, this is not SciFi, nor a Magic trick, but proven technolgy based-on real physical Newtonian principles. This technology is being utilized in NASA and by the commercial sector, but to my knowledge has not yet been performed in space by amateur radio/near space ARHAB developers.

Q: Would you be interested in flying and taking photo's of one or more of my small EP powerplant demonstration models on your next ARHAB flight? The primary goal would be to launch into Near Space, and at a pre-determined altitude activate the EP Powerplant while monitoring (capture data) its ability to "produce lift", and then photo/video the event. Once again, after balloon burst, re-activate the EP Powerplant while monitoring (capture data) its ability to "sustain" a given altitude, and then photo/video this final event.

This is an opportunity to yet again break new ground in ARHAB technology, create an historical event, and to set a new standard in maneuverable amateur radio high altitude balloon (MARHAB) satellites.

If you are interested, we can discuss the technical aspects in detail, at your leisure.

Thanks for the info Mike.

I figured it had to be something like that. I guess I'll start collecting some cameras. I like the Elphs but I'm going to try to decide on some particular model of digital camera. I might start writing letters to some companies and see what I can get.

2537. PSK and Voice bandwidth FM / was Other PIC projects by Mike N0QBH

Yahoo group: GPSL (2002 — 2008)

From: Hank Riley
Topic: 2532 Message: 2537

> I just got through testing an OT-PSK combined with my modified
> 12mw CW beacon. It works great on 2m FM

I have not had a chance to see if OT-PSK is any different than
the conventional PSK, so I'm commenting at some peril of
being off base, but I think I'm safe in saying that most or
all of the "weak-signal" qualities of PSK will be lost if the
signal is sent through a true FM transmitter and demodulated
by an FM receiver with the usual bandwidth filters (IF and AF)
suitable for voice.

Using an amplitude based modulation transmitter-receiver
pair, even if the transmitter is rudimentary, is the way to
go to retain the desirable qualities of PSK.

I guess using an HT and PSK would be an interesting experiment,
but many other methods of modulation will work as well,
or possibly even better, since the FM HT receiver bandwidth
and other factors are already spoiling the PSK recipe for
success.

MORAL: for best performance don't mix wideband FM with
single channel PSK

I just remembered that the PSK demodulation process using
a sound card may well provide a very narrow bandwidth
regardless of the wide FM rewceiver bandwidth, but the
problem is that there is already damage done in the
process of detecting the FM IF to audio at the usual
wide bandwidth.

That loss of S/N is gone forever, if the signal is not
over the FM threshold level at **point of FM detection**.
If one narrows the FM bandwidth too much as a workaround
to the above effect, then FM becomes noisier than AM.

It would be interesting to rigorously evaluate this
PSK_FM scheme in a controlled laboratory environment with
proper test fixtures and instrumentation.

I might be able to assemble the required setup this
winter.

Mark, Hank, Don,

I tested the OT-FM-PSK combo yesterday with both my TRB beacon xmtr and my peanut butter (PB) jar APRS tracker using the Alinco DJ-C1 and an outside antenna. I had a station listening on FM (Larry WW5WOW), he is 20 miles as the crow flies and he copied the OT-FM-PSK 100%. The TRB beacon was too weak for WOW to copy, but I am copying it 100% locally. I may stick the PB in the Jeep today while I'm out running around and see what I copy from my QTH.

Mark, I also think FM-PSK will get through where AX25 won't! It may be a while before I can confirm that!

When ANSR attempted to fly the cross-country flight several months back, I copied it's 20m PSK, on the ground in Truth or Consequences, NM from Tulsa with just a Cushcraft R5 vertical. I could not hear the signal, but the WinPSK program had no problem decoding it.

Troy, my APRS PB tracker is an OT, DJ-C1 and GPS. All I did was d/l the OT-PSK firmware file from... http://n1vg.net/opentracker/downloads.php and u/l it to the OT and fired it up. I ran an audio cable from an HT speaker jack to the mic input of an old laptop and brought up the WinPSK program... http://www.qsl.net/ae4jy/winpsk.htm and I was copying FM-PSK.

WB4APR's PCSAT-2 satellite onboard the ISS (due to be removed shortly) had a 10m SSB PSK uplink and a 2m FM PSK bent pipe mode on it. They never had much success because it required something in the order of 400-600 watts to get heard on the downlink... I'm wondering if there's more conversion loss than they thought... Not that it's a big problem for nearspace balloons, but using the FM PSK downlink made doppler correction basically unnecessary.

From: Mike Manes
Topic: 2548 Message: 2548

Hi Harry,

Hey, great landing pix from GPSL. Glad you were able to blow off the shards soon enuf.

Sure looks like you cud use a "plumb bob" payload at the bottom of your flight string - plus a bigger, vented 'chute. Getting PBC at 1700' MSL is bad form -- bad, BAD form -- rolled-up newspaper 'crost the snout bad :=}.

For ARHAB purposes, a "plumb bob" has a real fast terminal velocity, i.e. heavy and streamlined along the payload line axis. Using the 4-line support will impair the effectiveness of the plumb bob, since it'll transfer the instability of the upper "barn door" payloads all the way down the line. If the plumb bob doesn't have a camera, let the sucker spin.

Topic: 2548 Message: 2549

Hi Mike,

That's the first time I've seen it rotate that bad. I think keeping the shards might have helped. The total payload weight was at or over the max for that 36" chute. It does have a 3" vent and it was right at the velocity I had anticipated. I will probly get a 48" chute in the near future.

I'm not sure if you saw the short video of the landing or just the still pics. The landing video is on the ORB Yahoo Group FILES section. If you haven't seen it, take a look. It really shows how bad the rotation was. The two bottom capsules (rabitt & cameras) actually bounced off the grass, but no damage!

My son commented later that if he would've got there in time to catch it, he might have got that "newspaper" across his snout in the form of a capsule. :)

2550. Re: [GPSL] Project Request to Fly My EP Powerplant ...

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-18 18:06:11 UTC
From: Mike Manes
Topic: 2488 Message: 2550

Hi Dominick,

Your project sounds interesting, and I'm sure that any number of balloon groups would be interested in flying your EP propulsion device.

However, there are some FAA issues to deal with, specifically FAR 101 payload weight limits and further, new FAA regs regarding unmanned aerial vehicles, which the FAA has determined to be anything that flies between 700 ft AGL and 60,000 ft MSL and can be steered. There might also be some question whether this EP device might be considered to be a rocket under FAR 101 as well. Note that if it shut down below 60K', then it's probably not an FAA issue, however.

So .... how much does this guy weigh, including batteries? And how would the thrust direction be controlled? And finally, what is the source of the mass being accelerated to produce Newtonian thrust?

Oh -- and would this flight be in support of a commercial activity? If so, then this could raise some FCC Part 97 questions.

Mark,

You'd said in an earlier email that you were using DataTrak code in a new PIC and installed on a TinyTrak III.

What kind of details can you give on that? Is there a manual for it? Do you just send data with it? In other words do you have to parse the GPS and format an APRS string in the flight computer ? If you do, what do you use for a MPU? I'd think that an BS-2 would be a bit under powered.

I'd really like to get some more functionallity for data transmission without having to use a KPC-3 and this sounds like it should do the trick. But if the BS-2 is going to have to parse the GPS strings and format an APRS string, then there won't be much space left for it to do anything else.

Id like to see several super launches. Each one should be timed so they don't conflict.

Paul

>>> Troy Campbell <kc0mic@...> 08/17/06 5:17 AM >>>
Funny you should mention that. We've got NSTAR, NearSpace Ventures, CAPnSPACE, HABITET Skylab, CNNSP, KCATV and a student group in Lawrence KS all pretty close by. I was thinking of aranging a Midwest GPSL sometime if it didn't conflict with GPSL.

Maybe instead of a formal "gathering in one place" we could coordinate launches.

Maybe not.

Troy

wb8elk@... wrote:

> Maybe we ought to declare 15-August National Near Space day and have coordinated launches on that day. - Troy

Next year I plan to hold a 20th anniversary balloon celebration in Findlay, Ohio near August 15th, either the weekend before or after and to include a special flight on the actual day.

All are invited to watch or launch and I hope as many of the Aug. 15th balloon folks can attend as well.

This will be something of a Midwest version of GPSL.

See you next year - Bill WB8ELK

Hi Harry,

No, I didn't look at the video - one of these days I'll get fast i'net access, but 'til then, gotta live with dialup rates. However, the stills were plenty good to get the idea - in fact, I coulda used one of 'em in my pitch at GPSL this year!

The reason I suspect the 'chute / barn door combo is that it sure looks like the payload string was generating close to the same drag as the tilted parachute - there certainly was a lot of air dumping laterally under the 'chute skirt driving it sideways.

Re the shards possibly helping: only if they generate more drag than their own weight, and I've never seen that happen. Hanging a few lb of junk off the 'chute apex isn't a swell idea. And if the shards tangle in the shroud lines or canopy ... well, you know what ensues.

The smallest 'chute we've ever flown is 5 ft diameter with a 6" diameter apex vent. That's what we flew at GPSL 06, BTW, and even with 11 lb, descent was graceful. Of course, we had the "plumb bob" AE0SS-11 beacon as tail end charlie.

Hi Troy,

THe KPC-3+ is a full-blown TNC, meaning it can hear as well as talk. That means that it can serve as a digipeater or node, and it will abide AX.25 CSMA/CD protocol (won't step on another packet). The TT & ilk do have rudimentary "channel busy" capability, but it's just a rec'd audio level detector.

Perhaps someday Kantronics will come out with real small and light SMT version of the KPC-3. Waitently paiting ....

Hi Mark,

The full PPT file is over 25 meg - no way on dialup. Rick may have cut
it over to a smaller PDF on www.eoss.org. If not, then I've put the
last 2 slides into a small unembellished PPT: fastrelease_lite.ppt, attached.
The rest of the pitch discussed PBC causes and cures.

I kinda gives you the general idea - and please note that this design
doesn't even qualify as a prototype; it's just a proof of principle, and
can be vastly improved upon. BTW, I used 0.078" 6061-T6 Al sheet for the
jaws and hardware store stuff for the rest.

I did try to make part drawings in AutoCAD - but after 10 hrs of dealing
with a user interface that makes APRS-SA look friendly, I gave up :={.

2559. Re: [GPSL] PSK and Voice bandwidth FM / was Other PIC projects by Mike N0QBH

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-19 14:51:48 UTC
From: Hank Riley
Topic: 2532 Message: 2559

>Mark, I also think FM-PSK will get through where AX25
>won't! It may be a while before I can confirm that!

It would be hard to think of any scheme that would
not get through better than AX25!

I believe that if the CRC checking were removed from
AX25, there would be a big improvement in performance
as far as a lower S/N ratio being adequate to get
some data through with minor errors.

Such loss of 100% data accuracy might well be tolerable
in lots of amateur apps, especially balloon work where
there is a lot of redundancy due to the "a priori"
knowledge of certain aspects of the geographic track
and other payload data content, plus the frequency of
data packets.

If you compare CRC and non-CRC systems, it's "apples
and oranges." That's okay, but it just needs to
be understood that it's not a level playing field and the
disadvantage is on the side of the CRC system.

I have successfully transmitted serial balloon telemetry
data at something like 75 baud (maybe before PSK was
devised) using "on-off CW" at 2 meters. It was way, way
more efficient than AX25. It didn't have CRC, but that
could be easily incorporated. Having CRC would decrease
performance but it would still beat AX25 due to the
decreased bandwidth that can be used with *any* slow signal
like 75 baud serial.

Note that the on-off CW serial is an unconventional mode
and no sound card was employed in its detection. I'd like
to find someone who could program that so that a sound card
solution would be available.

It seems like the modes being used and tried for balloon
work are predominantly based on what is available
off-the-shelf. Perhaps more approaches should be
investigated that enable *primitive* transmitters to be
employed, even if that entails receiving systems that are
out of the ordinary for the mainstream terrestrial ham
radio market.

Hank

2560. CW QRP telemetry data reception and accuracy

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-19 15:53:30 UTC
From: Ralph Wallio, W0RPK
Topic: 2560 Message: 2560

I routinely receive and report QRP CW telemetry from CubeSat spacecraft in orbit. See http://showcase.netins.net/web/wallio/CubeSat.htm for frequencies and links for CUTE-1, CubeSat Xi-IV, CubeSat Xi-V, Cute-1.7 (now just a constant carrier) and (soon to be launched) HitSat.

CW transmit power from these nanosats is 80-100mW into simple monopole and dipole antennas. Orbital height is 600-700km. Slant range at AOS/LOS is ~2,500km where path loss is significantly greater than for ARHAB payloads.

Telemetry reception and accuracy approach 100% AOS-to-LOS. This is accomplished by capturing audio in a PC file and then replaying the file as many times as necessary to be absolutely sure which CW characters were sent. Free dictation software allows playback to be slowed down or speeded up (both occasionally help) with constant or variable pitch.

Reception and accuracy are significantly better than PSK-31, MFSK-16 or any other weak signal digital mode including those with coding gain.

The downside is that reception and accuracy by ear of an experienced operator is substantially better than any soundcard CW software (of which I find CWget to be the best). Operator CW skill and experience is required. My KN9JPR novice year in the mid-50's pays off again.

On the CRC checking, you can disable it on KPC-3's at least by doing a PASSALL OFF. I'd image similar functionality is available on other controllers. We usually chase with ours turned off, but I can't say as though it helps. The packets that aren't 100%, tend to be more like 60%. YMMV.

If you're wanting the PC to decode Morse, I've been extremely happy with MRP40 Morse Decoder. As for just OOK, I suppose it may have value, especially in the sense of cheap, simple backup transmitters. However, I personally think us hams need to pull out of the 1980's and go for something with a little more bandwidth than 1200 baud packets. As I recall (and it's been a while), there's plenty of bandwidth available for high-speed data links at either 900MHz or 1.2GHz.

2563. Re: [GPSL] How it works: EP Powerplants ...

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-20 04:16:16 UTC
From: Dominick Marrone
Topic: 2488 Message: 2563

Saturday, August 19, 2006

Hello Mike Manes and the EOSS team,

In answer to your questions: This is not a commercial venture, but the information gathered on this mission will be used as a technology demonstration on my website www.jvril-science.com , as training material to promote this field, and shall be made available to those Near Space groups; e.g. EOSS, NSTAR, TV-NSP, etc. who have contributed to this project.

FAA Regulations: I have studied the FAA Far 101 regulations, and I believe this flight vehicle would be compliant with their rules: It shall be tethered to balloon flight vehicle (at all times), is unmanned (flight computer controlled), flight capsule shall weigh less than 6lbs, and it shall NOT use any form of solid, or liquid propellant fuels, ordnance, turbo-prop jet, turbo-fan, or blowers of any kind for propulsion.

Although it is similar in nature to an Arc-Jet, as used on NASA space vehicles, this EP powerlant will not be "injecting" any propellant fuels, hence it does not utilize an electric arc-jet stream (a.k.a. Electric Rocket Propulsion System or ERPS) -- in fact, it is designed deliberately to eliminate the need for injected fuels, or arc-corona effects, as corona would only diminsh its thrust capability.

History: Briefly, this EP powerplant is based-on the concept of "Electric-Gravitic" propulsion as originally invented by Dr. Biefield Bahnson and Thomas Townsend Brown (circa 1950 to 1960) during their military research (now de-classified) project called Winterhaven. This technology was released as of 1973's Freedom of Information Act, and has been replicated by a few individuals in Acadamia, including: Cal-Tech, Stanford, MIT, and myself at the Academy of Aeronautics (Vaughn) in 2005.

HOW DOES IT WORK: Essentially, this EP powerplant utilizes a 12VDC, 4A Power Supply (but for ARHAB, I shall use an Ion-lithium Battery Pack of 12VDC, 4Ah) to power a custom HF/HV Pulsed DC Generator feed into an Ion Accelerator to produce Pulsed DC of 35kV -to- 50kV, 1ma at 30kHz. The special Ion-Emitter and Ion-Collector terminal pair (metal composites) used to produce thrust is seamlessly integrated into the microvehicle airframe by design. The airframe is tethered to a fixed surface (ARHAB Payload Capsule) to provide the microvehicle a means of controlled directional thrust. It is possible to produce full X,Y,Z directional controls but this requires substantially more electrical power (and weight). At present, the record lift is at approx. 1.0 lbs and requires a EP powerplant of 100kV, 5mA and an microvehicle airframe nearly 8 foot in diameter. For this EP Project, I shall be using a scaled-down system to ensure safety, and to establish the dynamics between ARHAB and
EP powerplant. For this first amateur radio prototype, the near space microvehicle shall only utilize Z-thrust (up/down), or alternatively pivot the thruster about a veritcal axis to produce rotary motion.

(Tesla) Teleforce Thruster: As positive Ions at the Ion Accelerator's Emitter (special material, non-radioactive) excite and escape their terminal, ions travel across an

asymetrical band gap (insulator), being attracted and accelerated toward the opposite facing negative Collector terminal (special material, non-radioactive). As it turns out, this ion acceleration produces a Newtonian-type force which is "opposite and exponential" (greater than equal) thereby producing an overall thrusting force. In actuality, this does not violate Newtonian Law but instead this is an anomalous condition that only occurs under specific 'artificially' created and controlled conditions, similar to how the anomalous phenomenon of diamagnetic levitation defy's Earnshaws Law of Magnetics. In essence, this sub-atomic quantum force is creating a condition which may be called AntiGravity, as its force acts against the normal force of gravity. This Teleforce Thrust originally invented by Nikloa
Tesla, is truely amazing to witness, as the craft lifts-off the ground, with the throw of a switch, and accelerates into the air (at speeds of Mach-II) without the aid of propellants, propellers, turbofans, or blowers.

Of course, there is much more science, and electrical design involved in this type of electric propulsion powerplants, such as: accelerators, material science of terminal pairs, biefield-brown effect for teleforce thrust, etc. but this gives you a good detailed description of the concept and how it works.

MY SITUATION: I am currently living in Queens/L.I. New York which makes it nearly impossible to launch an ARHAB satellite, as I am within 5miles of two Int'l Airports, and surrounded on three side by ocean! I can seek help from Rutgers University, but they are in the Bronx, NY and I am not a student. I am funding this project out-of-pocket, and hope to obtain educational sponsors, and/or amateur radio enthusists that would like to see this field experience technological growth.

EOSS WEBSITE: Your EOSS website claims, that they are willing to provide help to educators that are interested in ARHAB near space projects. At present, I am an amateur radio instructor for the New York Hall of Science Amateur Radio Club, a ARRL Hudson Division - Registered Volunteer Instructor (VI), and the founder of an online distance learning center at: www.jvril-science.com (scheduled to debut in September, which also provides training in OSCAR, ARHAB, and also has its own Near Space Program (JVRIL-NSP). As an educator, I have created several scientific programs: In June, I performed a demonstration launch of a prototype OSCAR satellite as an Early Warning Weather Station at the ARRL Field Day Event, and just this past weekend I hosted the Perseids Meteor Shower DXpedition: Forward Meteor Scatter with the Beltzville State Park, P.A. Lehighton Astronomical Society.

WHY THIS TECHNOLOGY IS NEEDED: As an example, EP propulsion will provide the ability to place an OSCAR / ARHAB satellite in near space with sustained manueverability opening the door to a world of new near space applications including: amateur radio-astronomy telescopes, amatuer radio weather stations, and local amateur radio digipeaters to provide extended DXing capability (similar to Meteor Scatter), to name just a few. NASA and Acadamia are currently working on accomplishing this task through the CubeSAT program (which I am also researching), but the ARHAB BalloonSAT is safe, low cost compared to rocketry, and being championed by fellow amateur radio operators -- who are do'ers, that do not get bogged-down in red tape, who are accustomed to designing/fabricating from scratch, who give credit where credit is due, and who openly share information for the good of the field; e.g. ARRL publications, QST-VHF, TAPR TNCs, Moxon Beams, etc..

Q: Would EOSS like to assist me in launching my Electric Propulsion powerplant into Near Space?
Q: Can EOSS help me acquire financing of this project, or lend equipment, facilities, OSCAR

/ ARHAB technical expertise during this project?
Q: Can EOSS provide for the launch, tracking and recovery of this OSCAR / ARHAB vehicle?
Q: Will EOSS have difficulty crediting myself, and JVRIL-NSP for the accomplishment of this EP propulsion project?

I do not have any problem with crediting and sharing technology with those who have contributed to making this OSCAR / ARHAB launch and EP Project possible.

Please Advise.

Mike Manes <manes@...> wrote:
Hi Dominick,

Your project sounds interesting, and I'm sure that any number of balloon groups would be interested in flying your EP propulsion device.

However, there are some FAA issues to deal with, specifically FAR 101 payload weight limits and further, new FAA regs regarding unmanned aerial vehicles, which the FAA has determined to be anything that flies between 700 ft AGL and 60,000 ft MSL and can be steered. There might also be some question whether this EP device might be considered to be a rocket under FAR 101 as well. Note that if it shut down below 60K', then it's probably not an FAA issue, however.

So .... how much does this guy weigh, including batteries? And how would the thrust direction be controlled? And finally, what is the source of the mass being accelerated to produce Newtonian thrust?

Oh -- and would this flight be in support of a commercial activity? If so, then this could raise some FCC Part 97 questions.

Agree. If the issue is battery consumption by the balloon beacon transmitter, a constant amplitude envelope is maximally efficient, since it can use a non-linear RF power amp. Examples are CW, FSK, bPSK, FM etc. SSB, AM, QPSK+, QAM etc all require linear PAs, which are very poor converters of DC power.

At the receiving end, the narrowest bandwidth takes the nod, since the receiver doesn't have to inhale so much of the noisy spectrum. This is the benefit offered by PSK31, which needs only 32 Hz receive bandwidth, compared to 15 KHz for FM packet/voice. QPSK+ offers better processing gain, but costs you in beacon xmtr DC power.

Thanks, Rick -- altho I assume all that cute, cute, cute animation
I used won't run :={. I think simply dumping that hightop.gif wallpaper
would chop 80% of the filesize from the ppt, tho. Mebbe I'll try that.

For Mark: one thing that doesn't appear in the ppt is an arming device
that keeps the jaws closed until after launch and above turbulence.
The device I've flown so far uses a thin nylon cord with a small NiCr
burner that can be commanded - there's also a backup burner that cuts
the yoke line going to one of the jaws - that will force the jaws open
even when there's tension on the lift line. I'm working on a barometrically
armed device using a anaeroid from a VIZ RAOB. Hope to test it on
EOSS-112.

2566. Re: [GPSL] CW QRP telemetry data reception and accuracy

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-20 03:44:51 UTC
From: Mike Manes
Topic: 2560 Message: 2566

Hi Ralph,

Hear, hear! I have a sweatshirt that one of our "newbies" brought back
from Dayton a few years ago. It is emblazoned with the image of a J-38
and the slogan "Without CW, it's just CB". Ham geezer snobbery - yes;
I earned KN4VBT in 1960 and my Extra the hard way.

I agree that CW in the ear of a skilled brasspounder enjoys "processing
gain" as yet unmatched by any windoze vaporware. However, I'll danged if
I'm gonna sit thru an entire flight keying in CW balloon payload TLM in
real time. If there's enough battery capacity aboard to support a cheap
GPS, then there's plenty to support 2m FM 100 mW 1200 baud packet APRS
beacons at 60 sec intervals for a 2.5 hr flight plus a 3 hr recovery.
That's plenty for a LOS path to the launch site and to a well-positioned
tracker, especially if there's 15 sec+ DF carrier provided.

Now, for those long-duration flights, it might be a good strategy to shut
down the GPS and radio 90% of the time, except during descent and in
controlled airspace, to save batts. But you'd still have to feed the GPS for
about 60 sec to let it get a fix, and then ship off a 1 sec packet burst -
or a 5 sec PSK burst. After all, if it weren't for the weight of batteries,
there'd be no compelling reason to run QRPp on balloon beacons (yeah, yeah,
I know how much a full gallon PA weighs - that's not my point). This is
why I think the pocket tracker scheme of killing IC and radio power, while
leaving the 1/2W+ GPS powered up continuously, is kinda silly.

BTW, PSK31 directly on the carrier will get thru when 1200 baud FSK packet
won't. It's a noise bandwidth / processing gain issue. Using a 1 KHz PSK
subcarrier to drive an FM xmtr at 4 kHz dev loses most of that advantage,
as noted earlier.

But .... CW still rules.

2568. Near Space Video

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-20 14:39:08 UTC
From: PAUL VERHAGE
Topic: 2568 Message: 2568

After having travelled to 6 near space launches this summer, I'm thinking of doing more next year. In fact I'd like to make a video of my trips and edit it into a 30 minute video. So I'm looking for ideas and schedules for summere travels next summer. I'd like to do a few BalloonSat classes, give a few presentations, visit some historic near space locations, and do launches. I would save some money if I can do this in a single trip that loops around the US rather than travelling back and forth like I did this year.

I know a year in advance is too far for people to plan launches, but still let me know if you'd like to arrange a launch or presentation next summer. Next year I'll contact ham clubs who have never been involved with a launch and see about presenting to them (and inviting them out). If you know of any groups that may be interested in making a BalloonSat for launch, please le tme know, also.

Paul

2569. Launched All States

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-20 14:46:19 UTC
From: PAUL VERHAGE
Topic: 2569 Message: 2569

We'll I launch in my 8th state this weekend.

I'd like to start the launched all states award that I mentioned at GPSL 2006. Here's some ideas I have. I'd like to get some more opinions.

I think the award should be given for balloon flights that reach near space (60,000? feet or higher). The launch must have been recovered, or at least there must have been an honest effort to recover it. Perhaps the launch should have also recovered in the same state, so the award also includes a recovered all states award.

I don't know what to do about people who are attending a launch but did make the near spacecraft. I think you should only be awarded a state if the stack includes a payload that belongs to you. So someone who made a non-tracking BalloonSat is eligible for the award, even though they depend on the tracking near spacecraft to get the BalloonSat back.

To be eligible, I think you should be there to launch, chase, and recover.

Ideas?

I would issue an award for every five states.

Paul

2570. Re: [GPSL] Camera

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-20 15:45:06 UTC
From: Mark Garrett
Topic: 2488 Message: 2570
Attachments: 2 described; binary payloads are missing from this source WARC

I agree as well. Paul, that Geo with a APRS tracker. Maybe Paul should go one step further and place a display and keyboard to handle messages as he travels from launch to launch. Then we could text him while on the road.

Which brings up an idea for APRS. There should be the ability and a site much like Echolink where you can enter in your callsign, get a map display of those with message capability click on them from the display and enter a message to them.
More and more amateurs would use APRS if they had the ability to send a message to each other. By nature of APRS it would be brief but it would add value to a system that already exists.

I only use APRS for monitoring balloon flights especially thru I-Gates since I cannot be there most of the time to participate, otherwise looking at all of the weather stations and stationary objects leaves a lot to be desired. Maybe with message abilities a message could be sent back such as data telemetry or distant tracking information.

Comment among yourselves, I will not be able to post back for another week.

Hi Paul,

Would this award go to individuals or entire groups? If for groups, then
a single magazine subscription isn't really of value. However, if it
covered fuel costs ... :=}

I'd suggest that a flight crosses state lines, then ALL states which
the flight crosses should count towards the total. This would give
some leverage to the smaller NE states, which would partially compensate
for the likelihood of a maritime landing. It would also tip the scales
towards long-duration flights.

I do think that recovery should be a requirement, however; what constitutes
an "honest effort"? A return address sticker? Perhaps maritime landings
could be exempted - but as U PR SGC has shown, maritime recoveries are indeed
feasible, and with proper forecasting, both avoidable and not unexpected.

Lessee ... by this standard, EOSS has launched from CO, WY, KS & IA and
recovered from CO, WY, KS, IA and NE. We've crossed the CO/WY, CO/NE &
WY/NE state lines.

73 de Mike W5VSI, EOSS

PS: Would this be a good time to reintroduce the gross tonnage award :=}?

2574. Re: [GPSL] Near Space Video

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-21 02:32:51 UTC
From: Mike Manes
Topic: 2568 Message: 2574

Hi Paul,

The EOSS docket for 2007 is already fleshing out with 12 flights so far:

EOSS-115: __ Feb: EOSS Midwinters 1 x 1200 Windsor CO
EOSS-116: 17/18 Mar: Big Blue IV; 1 x 54K ft? plastic burster Windsor
EOSS-117: 14/15 Apr: CU & DemoSats 1 x 3000 Windsor
EOSS-118/119: 30/31 Apr: USAFRL SHOT I 2 x 3000 Deer Trail CO
EOSS-120: __ Jul: GPSL 2007 1 x 1200 Nebraska
EOSS-121/122: 14/15 Jul: Workshop / Upward Bound 2 x 3000 Deer Trail
EOSS-123/124: 28/29 Jul: Colo SGC DemoSat V 2 x 3000 Deer Trail
EOSS-125:__ Oct: Pike's Peak BSA JOTA 1 x 1200 ?(E. of Colo Sprgs CO)
EOSS-126: 10/11 Nov: CU Gateway 'sats 1 x 3000 Windsor

These are also listed on www.eoss.org, where updates will appear as they occur.

Dates for 115, 120 and 126 remain TBD. 115's date could be tweaked a bit to accommodate your plans, but I suspect that's not part of your summer tour. I'd expect that there will be one or two more latecomers as well, e.g., NOAA Aircore, but those most likely wouldn't fall in the summer rush.

Since you've had some experience teaching balloonsat classes, Chris Koehler may be interested in enlisting your assistance with one or more of his Colo Space Grant classes (117-119, 121-124, 126).

Zack,

In the context of balloon transmitters where we're talking
about getting the signal through with maximum data fidelity
with minimum power, one actually wants as SLOW a data rate
as is practically possible.

State of the art modulation and detection schemes (that hams
use) can go way below 1 baud (deep space probes).

The discussion of what should be done with AX25 packet
for general use is another topic altogether.

I want to emphasize that, at least in the context stated
above, slower is better.

Hank

Hank's right, Zack. For a given modulation scheme, increasing data rate requires broader receiver bandwidth, which raises the received noise power and thus the required ERP necessary to maintain an adequate SNR. The converse is also true, which is why PSK31 gets thru even when the signal is buried in the noise at a 3 KHz wide SSB receiver. DSP processing gain effectively reduces the receiver B/W to about 31 Hz - with a 20 dB improvement in SNR.

That's not to say that we shouldn't try faster data rates, however. But if we do, then we should also be prepared to feed a hungrier xmtr or use more antenna gain on the ground - or both.

Perhaps the quickest route to an 8x increase in downlink data rate would be to try 9600 baud PSK packet - radios and TNCs capable of that mode are available now. However, just be aware that those who have tried this mode, even on terrestrial links that are made easily using 1200 baud FSK, have had to do a lot of tweaking just to get it to work.

HABET-2, -3 and -4 all used 9600bps FSK 70cm downlinks back in 1993-1994. Our payloads used G3RUH
FSK modulators driving 1W UHF HTs and simple omni-directional monopole antennas. Our downlink
worked flawlessly.

Performance and throughput of 9600bps FSK is substantially better than 1200bps AFSK/FM when care is
taken with impedance matching and signal level between modulator and transmitter (the tweaking Mark
mentions).

OSCAR engineers consider 9600bps FSK to have 5.2dB -better- SNR performance than 1200bps AFSK/FM.
An 18dB Eb/No (SNR) is required for a bit-error-rate of 1E-05 with 9600bps FSK whereas 23.2dB is
required for 1200bps AFSK/FM.

Design and tweaking time and effort can provide significantly improved downlink bandwidth.

Taylor University is using off-the-shelf Part-15 (unlicensed) 902-928MHz spread spectrum radio/modems. FREEWAVE is one manufacturer of these (up to) 1W devices, see http://www.freewave.com/. They are comparatively expensive radio/modems but yield a fully error
corrected link with throughput far exceeding what we are doing with Ham Radio methods. (Taylor is
working on use of these devices in spacecraft with slant ranges out to ~3,000km.)

I have a pair of these devices available for testing. Roughly 11dB fixed site antenna gain is
required for a ~100-mile path. A link margin spreadsheet is available. But it is not Ham Radio.

We use the 900 Mhz unit as our main tracking in the
chase team van with a 6dB gain yagi pointing straight
up this has works very good and we have not lost the
link to the balloon. From the portable command trailer
with the 10dB gain yagi we are able to link with the
balloon over 157 miles with out lossing it.
The command Yagi is 10 feet above the ground and the
balloon with a 3dB patch can be linked to 2500 feet
above the ground.

Hi Mike,

No, I have no direct experience with the HH. The designer/developer, Steve Bragg and I used to be in a small rural HAM club in the Tulsa area. Steve would always ask what we thought about it as it evolved. Steve moved from this area to W. Virginny a couple years ago and I don't hear from him very often.

Several years ago as I was traveling from Roswell to Amarillo, I was just outside Clovis with a stand-alone tracker on the air and a HAM passed me and flagged me down. He had been tracking me using a HH and saw that we were close and thought it would be nice to have an eyeball out in the middle of nowhere.

That's my story and I'm stickin' to it!

:)

Jeff,

Thanks for the details on your chase setup. I had remembered the yagi
being attached to the driver's side mirror and assumed that the driver
periodically had to repoint it.

If you make it to GPSL 2007 I'd like to take a closer look at your chase setup.

Before we start talking about increased data rates, I'd like to understand a bit better what the enhanced data rate would be used for. If we're only going to be sending status/location information, then does it really matter whether it's sent in .5 seconds or .1 seconds? For that matter, it might even be better to slow the data rate down, since position reports are really only needed ever few minutes, and take advantage of the narrower bandwidth and reduced transmitter power.

As for the increased data rate, I really doubt that we'll be sending any type of digitized live video (which requires a HUGE bandwidth) [2]. Even some type of SSTV or still pictures would require a rather large increase in the data rate (much greater than 9600 to be practical [1]).

[1] Yes, I know that people used to send images over 300 baud accoustical modems, but I'm trying to forget those horrible memories!

[2] There have been quite a few payloads which have downlinked live video over an analog channel. But, I assume we're primarily talking about digital data channels here, since the analog video channels already have a rather huge data rate/bandwidth.

I suppose what I'm really trying to get at is that the data rate needs to be large enough to handle the data that's being sent, but any larger is a waste.

> Perhaps the quickest route to an 8x increase in downlink data rate would
> be to try 9600 baud PSK packet - radios and TNCs capable of that

FSK,
> have had to do a lot of tweaking just to get it to work.

I'm not sure that there would be much advantage to just going to 9600 baud. While that sounds like an 8X increase at first, the turn around time delays means that it's not quite as much of an increase. But, even an 8X increase wouldn't allow video, and almost certainly not reasonable resolution still pictures. That's way too slow for digitized voice. Thus, I'm not sure what 9600 baud would buy.

If someone is really interested in pushing the data rate up to the point where digitial photos could be downlinked, then 50K would seem to be the bare minimum, and faster would probably be better (Oh, and don't forget to consider the protocol so that lost packets don't ruin the image.). On the other hand, quite a few balloons have had real time (analog) video downlinks.

For the ultimate in bandwidth, one possibility might be some of the microwave bands. It should be reasonable to fly a 10 GHz Gunnplexor transmitter: power budget and weight, although it may be better to design a light weight cavity rather than use standard (heavy) waveguide and horn antenna. Given the mechanical dynamics of high altitude balloon flights, there may need to be a tradeoff between antenna gain and beamwidth (High gain doesn't do any good if the antenna is constantly pointed in the wrong direction due to winds swinging the payload, although some type of stabilization system might help). On the ground, though, it should be possible to use a reasonably sized dish antenna (even for mobile chase teams) to improve the received signal levels, and thus the S/N ratio.

Another possibility for ultimate bandwidth might be to use a laser transmitter on the payload. The advantage is that the beamwidth is extremely narrow, so the effective transmitter power is concentrated. The disadvantage is that the payload will almost certainly be swinging wildly, and the amount of time that the beam is centered on the receiver will be exceptionally short (but long enough for an ultra-high speed data packet to make it through?). A laser pointer is probably small and light enough that some type of gyroscopic stabilization system may be a possibility, although there would need to be a significant amount of mechanical design work done to support this. On the ground, the use of large (fresnel) lenses and narrow band optical filters to remove most of the ambient light might allow enough signal to be received to have a useful S/N ratio. Maybe. In any case, it might be something interesting to try, given that the payload weight should be fairly reasonable.

The HABET2-4 HT was an older commercial UHF radio crystalled to 446.000. G3RUH FSK modulation went
directly to the FM modulator bypassing all transmit audio stages, e.g., MIC AMP and IDC limiting.
This is a typical G3RUH FSK modulator to FM transmitter mating.

Hams can use the 902-928MHz band but these Part-15 radio/modems use spread spectrum modulation
which, when operated under Part-97, would have to follow spread spectrum requirements. Applicable
rules and regulations, Report and Order FCC99-234, can be found on TAPR's web site via
http://www.tapr.org/ss_fcc.html. The high points:

-- CW or phone IDs are required (Part-15 radio/modems do not have this capability).

-- Specific spread spectrum coding is required (typically not followed by Part-15 radio/modems).

-- Automatic transmitter power control is required, e.g., the receiver tells the transmitter to
reduce power until it is just above what is required for a reliable link (not provided by Part-15
radio/modems).

So we have three major problems with off-the-shelf Part-15 'wireless I/O' products: lack of IDing,
SS coding and lack of auto xmit pwr control. It would take major hacking to fix these problems with
Part-97 but they are Part-15 compatible off-the-shelf.

Well, four major problems. The cost of these units is several hundred dollars each.

Ralph,

Thanks for the detailed description of the 440 MHz, 9600
baud setup, as well as the requirements for SS under
Part 97.

I'm not sure if it would be worth the effort to petition for
relaxation of some of the Part 97 rules since Part 15 is already
allowed for *use* by hams, but is not a ham-only privilege,
hence technically not ham radio.

CW ID might not be too hard to add.

Hank

2591. Pressure sensor

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-22 21:07:29 UTC
From: Troy Campbell
Topic: 2587 Message: 2591

Guys,

Is anyone using absolute pressure senors?

If so, what make and model?

Most of the sensors I've found that will meassure down to 2-3 millibars and are temperature compensated all appear to require some amplifier or driver circuitry as their ouput is in the millivolt range.

I'm going to want to use a Basic Stamp to read it, so it would be nice if there was something that could be connected without a lot of support circuitry.

Thanks in advance!

The 900 MHz ham band does overlap the 900 MHz Part 15 "electromagnetic
toxic waste dump" -- but it's still quite usable, since hams can use
any legal mode and up to 1.5 kw there :=}. Not the point for a balloon
downlink, tho.

NSTAR is using a Honeywell ASDX015A24R sensor. We get pretty reliable data out of it. The main issue is that the upper end goes to 5V and our current A/D converter has a limit of 4.096V, so the higher pressures are clipped to 929 millibars. Not a big deal. Needs only 5V in, minimal current draw.

I'm not sure of the absolute calibration, but it does great for detecting relative pressure changes.

The specs for it are just about perfect! Except digikey sells it for $33.00 Do you maybe know of another source (more cheaper?)

2595. Two Items for Checklist

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-22 21:49:44 UTC
From: PAUL VERHAGE
Topic: 2595 Message: 2595

On my last two launches, I came across items to add to check lists.

The first is to check the raw TNC data instead of just relying on the plotted position on Street Atlas. On my 06F launch, OIT launched their balloon after seeing that its position was properly shown at the campus. It turns out the GPS/TNC were just transmitting their last known location and not making updates.

The second is to measure continuity on the antenna elements before launch. On my 06G flight there was a broken wire on my dipole antenna. We received fixes from the near spacecraft while it was on the ground, but lost them in flight. Once it was near the ground we began receiving fixes again.

Paul

That's a pretty darn good price for a conditioned absolute transducer!
If you want cheaper, you'll have to roll your own instrument amp / signal conditioner to work with the raw strain guage signal.

EOSS uses an older version of the Honeywell that has a 1 - 6V output and runs off +8Vdc. It does have great specs, tho, but runs more like $75.

Hi Dave,
I guess that was addressed to me. And I agree that there's no point
in flying more bandwidth than what you need. However, we have flown
a number of student experiments that generated a huge amount of data.
At one time long ago, we would have tried to downlink it in real time.
However, with the advent of cheap, light data loggers, e.g. the Onset
Hobos and flash disks, downlinking has been replaced by payload recovery.
Logged data is correlated to flight parameters (time, altitude, lat/lon,
etc) via EOSS's own APRS data log on our web site.

2600. Data logging

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-23 14:17:41 UTC
From: mconner1@gmail.com
Topic: 2600 Message: 2600

Mike brought up data logging, which prompted me to go look for a data logger for storage to an SD card. I was really looking for another one I had found last year, but instead stumbled across this one:

http://www.sparkfun.com/commerce/product_info.php?products_id=752

This one can log serial ASCII data sent from a BS2 or GPS to an SD card up to 1.0 Gbytes in size (they're testing a 2Gb card). It also has a 10-channel A/D converter which can log up to 1500 samples per second (1500 Hz using one channel, or 150 Hz using all ten, or something in between). Price is $60.

The same site also has a 3-axis accelerometer for $40, which I think is pretty good. SPI or I2C interface. There are also some low-cost wireless TX/RX modules which could be used to send serial data from one payload to another.

Mark,

Good link, but too expensive for me.

Please keep looking for alternatives. I've seen some
stuff a year ago that was in the formative stages
(almost semi-DIY plans), so will look again to see
what's happened since. If we could get this done on
a PIC, maybe a balloon group PC board design and buy
could be accomplished (design board, buy boards, build
loggers).

Hank

2602. Re: [GPSL] Data logging

From: Troy Campbell
Topic: 2600 Message: 2602

I bought a gps/datalogger from these guys. It works great but will only record the GPS and there wasn't any way to tap the serial line from the GPS so that it could be fed to the TNC (tinytrak III). I haven't flown it yet but the GPS specs say that it will operate above 60000ft (if you keep the speed under Mach I)

It's very tiny, very light and a set of 4 akalines last about 6 hours (on the ground)

http://www.sparkfun.com/commerce/product_info.php?products_id=671

I wish there was a way to pull serial data from the GPS.

I didn't notice their standalone datalogger. It looks pretty functional for what we do. There was another one from rogue robotics we were considering. It's $50 canadian and appears to have about the same functionality minus the ADC channels

http://www.roguerobotics.com/products/electronics/ummc

The biggest difference (I think) is that the uumc logger will require software to open/close the files, write in a formatted fashion and "chunk" the data.

The sparkfun module will let you write a configuration file onto the SD card from another computer so that the logger will boot up automatically and just start doing what you want.

The sparkfun logger uses an ARM processor and consumes more power than the rogue unit.

The rogue unit is a bit more flexible in terms of file operations, but the sparkfun module has 10 ADC channels.

Either is workable.

In general, sparkfun has got a lot of stuff usable for ARHAB.

Another thing about sparkfun is that the product description on the web site will lead you to believe that the product will do just slightly more that the specifcations say it will do.

In the case of the 'log-o-matic', it does say it will store serial ascii and has 10 ADC channels. When you read the specs, though, you find that it the modes are mutally exclusive. The log-o-matic will record serial ascii OR ADC data but not both at the same time. That's not necessarily bad, just that you should know about it before you start designing around it.

(see paragraph 3.1 of
http://www.sparkfun.com/datasheets/Widgets/Logomatic/Logomatic_V1_0.PDF)

The other difference between the uumc and the log-o-matic is that the uumc supports FAT-32 and 2gb SD cards. The log-o-matic supports FAT-16 and 1gb SD cards.

The logomatic still looks like it's easier to hook to a BS2 though.

Troy,

CNNSP also uses the Honeywell ASDX015A24R with a HOBO datalogger. We lose some resolution through the HOBO due to the fact that the input to the datalogger is 0 to 2.5 volts.
You might try Allied Electronics, they're a little cheaper, but not much.

The specs for it are just about perfect! Except digikey sells it for $33.00
Do you maybe know of another source (more cheaper?)

NSTAR is using a Honeywell ASDX015A24R sensor. We get pretty reliable data out of it. The main issue is that the upper end goes to 5V and our current A/D converter has a limit of 4.096V, so the higher pressures are clipped to 929 millibars. Not a big deal. Needs only 5V in, minimal current draw.

I'm not sure of the absolute calibration, but it does great for detecting relative pressure changes.

Thanks Roger. I'd pretty much decided to to go with that sensor.

Did you receive your repeater?

Troy

Roger Hammond <rahammond@...> wrote:
Troy,

CNNSP also uses the Honeywell ASDX015A24R with a HOBO datalogger. We lose some resolution through the HOBO due to the fact that the input to the datalogger is 0 to 2.5 volts.
You might try Allied Electronics, they're a little cheaper, but not much.

A more effective way to check your antenna is with a simple field strength meter. I use the old Rat Shack CB SWR meter, but one can make one using a sensitive panel meter (100 uA FS or so) with a signal diode across the meter terminals - then add that assy to a simple dipole (a couple of 6" pieces of wire will do). When you know the antenna is working, check the distance from the antenna to meter to get a full scale reading.

This saved one flight 'way back when.

Whoa! Such a deal compared to the Onset Hobos being used in SGC balloonsats!
Hook one up to your GPS NMEA output and get a complete flight profile
after recovery, and that 10-ch ADC is real intruiging as well. Wonder if
it'll work down to -20C?

I'm using a SM5812 from Semiconductor Micro Structures for a sensor. I believe it can be ordered for a wide range of pressure ranges. They cost $32 a piece, but I was lucky and got two as samples.

I'll eventually write an article on using one as part of a weather station for near space.

Paul

>>> Mike Manes <manes@...> 8/22/2006 7:16:13 pm >>>
That's a pretty darn good price for a conditioned absolute transducer!
If you want cheaper, you'll have to roll your own instrument amp / signal
conditioner to work with the raw strain guage signal.

EOSS uses an older version of the Honeywell that has a 1 - 6V output and
runs off +8Vdc. It does have great specs, tho, but runs more like $75.

2610. Re: [GPSL] Launched All States

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-24 19:01:43 UTC
From: PAUL VERHAGE
Topic: 2569 Message: 2610

I'm thinking of a certificate for individuals. So there's no awards to handout. The average of my flights is a ground path of around 40-50 miles. Launching and recovering in most states should be possible with those kinds of ground tracks. It may mean, however, that you'll have to wait until weather conditions are right to launch in a small state. But we already have that with the traditional Worked All States award when you have to wait until propagation conditions are proper.

As far as recovery, I would expect that an attempt was made. I don't want to see people winner the award because they launched a balloon with clock crystal oscillator without even planning to chase and recover it.

Paul

>>> Mike Manes <manes@...> 8/20/2006 9:35:02 pm >>>
Hi Paul,

Would this award go to individuals or entire groups? If for groups, then
a single magazine subscription isn't really of value. However, if it
covered fuel costs ... :=}

I'd suggest that a flight crosses state lines, then ALL states which
the flight crosses should count towards the total. This would give
some leverage to the smaller NE states, which would partially
compensate
for the likelihood of a maritime landing. It would also tip the
scales
towards long-duration flights.

I do think that recovery should be a requirement, however; what
constitutes
an "honest effort"? A return address sticker? Perhaps maritime
landings
could be exempted - but as U PR SGC has shown, maritime recoveries are
indeed
feasible, and with proper forecasting, both avoidable and not
unexpected.

Lessee ... by this standard, EOSS has launched from CO, WY, KS & IA
and
recovered from CO, WY, KS, IA and NE. We've crossed the CO/WY, CO/NE
&
WY/NE state lines.

73 de Mike W5VSI, EOSS

PS: Would this be a good time to reintroduce the gross tonnage award
:=}?

From: PAUL VERHAGE
Topic: 2611 Message: 2611

I've uploaded a new video to youtube.com. In couple of hours you should be able to watch the flight of NearSys 06G. This was a launch for the Adler Planetarium. In it, I have footage of the balloon bursting. I could run it in slow motion, but couldn't so single frames. I'll see if I can get the software to do that and make a video just on that.

In my crude attempts to stop the frames, I can see that ripples run down the balloon as it shreds from the top.

Paul

2612. Lat/Lon resolution on APRS packets

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-26 22:46:57 UTC
From: Zack Clobes
Topic: 2612 Message: 2612

We've always flown the GPGGA/RMC strings for a variety of reasons. I'm now looking at converting over the ?more standard? single string format.

APRS:@164428h4029.84N/10427.34WO234/038/A=092748

Those who have flown (or tracked) the above string format with 1/100 of a minute resolution, do you have any regrets? I realize that GPS's only "guarantee" about 30' of resolution, which is about what you lose by dropping the last two digits of the Lat/Lon.

Also, does anyone know if it's possible to throw in all four of the decimal digits in the above string and still get software to track it?

Zack Clobes, W0ZC
Project: Traveler

Hi Zack,

That looks like the TinyTrak 3 ASCII format. It works and it's short,
but it doesn't show the status of the GPS signal. As Paul reported,
it's nice to know whether the GPS solution is valid (RMC) and how many
birds are in track (GGA). As a minimum, I'd stick with just GGA if you
can't add a validity field to the report (I think that format does
accommodate a "comment" field.)

If you roll your own posits using a PIC or BS2, you can do what NSTAR
does and put satellite status information in the comment field at the
end of the posit. Then you still have
time/lat/lon/course/speed/altitude in one report, plus how well your
GPS is performing.

Yes, I'm rolling my own controller. At this point, I'm leaning towards the single-packet posit, but having a flexible telemetry packet to supplement the posit.

Would the APRS powers that be have a fit with occasional telemetry packets that looked something like what follows? Having the data in an XML format would make it expandable as well as self-defining all at the same time. The following snippet comes out to roughly 300 bytes, and could easily grow to 600-1000 bytes before it's all said and done.

XML admittedly isn't the most efficient use of bandwidth, but hey, once I get my 384kbps duplex datalink going, that won't be a factor.. ;-)

```
<xml>
<telem>
<gps sats="6" lock="A">
<time>143523</time>
<lat>38 34.1234N</lat>
<lon>97 32.1234W</lon>
</gps>
<burst alt="29324" time="142303" />
<sensors>
<oat>-35</oat>
<iat>2</iat>
<batt1>8.32</batt1>
<pics_taken>54</pics_taken>
<atv>ON</atv>
<cutdown1>ON</cutdown1>
<cutdown2>OFF</cutdown2>
</sensors>
</telem>
</xml>
```

2617. Re: [GPSL] Lat/Lon resolution on APRS packets

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-27 21:22:18 UTC
From: mgray@ess-us.com
Topic: 2612 Message: 2617

As a side note to using XML for telemetry, there is a standard GPX (GPS Exchange Format) that utilizes XML. The format is supported for import and export by a number of applications including Garmin's Map Source and Google Earth.

http://www.topografix.com/gpx.asp

However, I would be inclined to continue the use of standard GGA/RMC packets for any tracking applications. That gives the most number of users the ability to track and recover a payload. I've flown a number of high speed data links, but it wasn't very useful because I was the only one who could receive them.

1200 baud A-FSK APRS isn't perfect, but it has by far the widest user group.

If you want more accurate data, I would log the raw data on board the payload at a higher rate (say every 1-5 seconds). You'll have full GPS resolution and a lot more data then you'll ever send and receive over an RF link.

2618. Battery Chargers

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-27 22:07:06 UTC
From: Harry M
Topic: 2618 Message: 2618

I would like a few recommendations on battery chargers. Please include make/model/source. I am looking to buy one that will do all types, including Lead-Acid, Gel-Cell, NiCad, NiMh, LiIon, and LiPoly.

Thanks!

Harry KC5TRB

I have and Zack has the first run Triton. Any of those will work.If you look at the specs. for the units,you will see the real differance is the charge rate.The T1 and jr are near the same.The T2 has more charge power. There are others available ,but I don't know much about them.

2624. Re: [GPSL] Lat/Lon resolution on APRS packets

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-28 00:55:42 UTC
From: Mark Conner
Topic: 2612 Message: 2624

Using XML in an UNPROTO form would be difficult being limited to
256-byte packets and the risk of dropping tags and so forth.

You may wish to check out the OpenTrac protocol. There's not a lot
out there for it right now, but would seem to be a good fit for what
you're looking for. I think it could eventually replace the APRS spec
if it weren't for the lack of backwards compatibility.

There was some discussion on the APRSSIG of certain OpenTrac packets
causing either D7's or D700's to do funny things. If you're using it
on a non-144.39 freq, I wouldn't be concerned at all.

You might design something that would send regular APRS-spec posits at
intervals and use OpenTrac for everything else.

> Would the APRS powers that be have a fit with occasional telemetry packets that looked
something like what follows? Having the data in an XML format would make it expandable as
well as self-defining all at the same time. The following snippet comes out to roughly 300
bytes, and could easily grow to 600-1000 bytes before it's all said and done.

Good info. Thanks Mike.
I had noticed references to GPX before from Garmin, but
never dissected the protocol.

> However, I would be inclined to continue the use of standard

The above philosophy of sticking with established methods
and standards certainly makes a lot of sense, and I don't
disagree. I do however feel compelled also to mention that
if everyone were to subscribe to that way of thinking, there
would never be anything but "1200 baud ASK APRS" available
for anyone's use.

Note that in general I would like to see slower rather than
faster APRS formats for amateur radio ballooning. Faster
is fine, too, of course, but it seems like the need and
payoffs might be greater for slower speeds and special
nonstandard formats comprising solutions that would suit
our niche problems and goals.

Hank,

I'll through my $.02 worth in here.

From a programming and systems communiction standpoint, XML is great. (maybe even "super") It's easy to parse, relative easy to validate (all the values have labels), can be 'hand cranked' when needed, human readable, easily extensible, etc. etc. I use it constantly in house.

On the downside, it is a bandwidth Hog. It was more or less designed for environments where bandwidth (and storage) is virtually unlimited, like a network connection or local harddisk, and supported by a protocol that shared the communication resource efficiently (TCP/IP).

The issue with 1200 baud A-FSK is not just message size but also the underlying protocol's (AX.25) packet size. The packets will fragment the message pretty severely, I would think, sending multiple packets for one message.

During a single flight, it wouldn't necessaryily be an issue. Unless you were using 144.39. In that case, a lot of other APRS traffic could get crowded out or YOUR traffic would get obliterated. I'd think packet collisions would go WAY up. Add digipeaters to the mix and I'd think that nothing productive could get transmitted.

There is such a thing as TCP-IP over packet, but it's a tunnelling protocol and isn't terribly efficient. Not to mention that APRS is a connectionless protocol and TCP-IP is a port based connectioned protocol.

Now, having said all that, I'm not the smartest guy in the world and frequently have been known to be wrong. XML for aprs would be cool and if you get it going efficiently (sharably) it'd be Good stuff. But I don't think the payload carrying capacity of the AX.25 on a 1200 or 9600 channel with the APRS connectionless protocol is going to be big enough. Except for maybe one or two stations at a time. So I guess I'm saying that XML would work but as a practical exercise, I think you'd have to move off the APRS band, move up to 70cm (at least), increase the baud rate, and figure out another protocol (maybe a UDP broadcast like streaming audio but unencoded). But then again, maybe not.

2627. Insulation

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-30 05:38:14 UTC
From: Brek Brixius
Topic: 2627 Message: 2627

To start, I would like to introduce myself to the group. My name is Brek Brixius. I attended GPSL 06. While there, I kind of kept to the shadows. I am currently working at constructing a balloon that I hope to launch in 2007.

Since I have never done this before, I have a lot of questions. What is on my mind at the moment though is, insulation.

At GPSL it seemed like folks were concerned about their packages getting cold and freezing. I am preparing to build my airframe and have been reading some NASA sites about MLI on spacecraft as well as a NASA site regarding balloons. In both cases, they seem to worry about heat - see the following taken from http://topweb.gsfc.nasa.gov/balloon/inside.html

"Balloons can fly to an altitude of 26 miles (42 kilometers), with flights lasting an average of 12 to 24 hours. Special Long Duration balloon flights can last for more than two weeks. When the balloon reaches 50,000 feet, the temperature drops to -70 degrees Celsius (-94 Fahrenheit). However, at the balloon's highest altitude it gets somewhat warmed up by the Sun and the temperature rises to about -40 Celsius (-40 Fahrenheit). Even though the temperature is still extremely low, there are often more concerns with the payload getting too hot than too cold. Since the air pressure is low (1/500ths of sea level pressure), cooling by air works much less well at ballooning altitudes than it does on the ground. So even though the outside air is very cold, it doesn't take heat away from the package very well, so the usual sources of heat (Sun, or the operation of electronics, etc. inside the package) can potentially cause the package to get very hot."

I wonder if they have heat problems do to the longer duration and/or higher altitudes?

Any comments you folks have would be greatly appreciated.

Thanks
Brek.

From: Troy Campbell
Topic: 2627 Message: 2628

Brek,

Welcome to the group!

You've pretty much hit on it. If you go to some of the ARHAB web sites you'll find temperature graphs and data that show that the temperature does get to -60 and below, but it get's _warmer_ as the altitude increases over 70,000 ft or so.

I think most of what you were hearing at GPSL has more to do with the fact that most of the ARHAB missions only last 2-3 hours and don't spend enough time in higher regions for heat management to become a problem. Also the 'higher regions' tend to be about 20 miles as opposed to NASA's 26 miles for 12-24 hours. (The six miles makes a difference.) In fact, some ARHAB designers COUNT ON heat from the electronics to keep the instrument compartment warm.

A couple of ARHAB groups do more long duration missions than others. It's pretty interesting to read their procedures and experiences. Most of what I hear from those seem to deal with keeping the batteries warm, especially after sunset.

While heat dissipation through convection is very limited at 4-3 millibars altitude, I don't think that ARHAB balloonsats use a transmitter duty cycle (time on vs time off) or pack the electronics so densely that waste heat is an engineering issue like NASA's spacecraft.

As to insulation, our current near-spacecraft is built from a Walmart $4.95 lunch bag with a hard inner liner. The temperature in-flight never gets below 10-14F. Our primary batteries are L-91 lithium "AA" batteries that seem to last for about 10 hours on the APRS transmitter and about 48 hours on the rest of the electronics.

Jon,

I have found the following FAQ. Have you had any similar problems with thte Triton charger?

73 Harry

Frequently Asked Questions

Using Lithium Polymer Chargers and Batteries

Quick jump to see other FAQs
Using Chargers & Batteries Flying the IFOs About IFO Model IFO Constructions FAQS Main Page

Chargers & Batteries:
Caution! when using Triton Charger with our Lithium battery pack
We've had several customers ruin our batteries using the Triton charger. But I think if setup properly, the Triton charger is fine. But, as a precaution at this time, I don't want to hear any more stories about the Triton charger ruining our batteries. I've ordered a Triton charger for my own investigation but here is what seems to be occurring. Apparently with the Triton charger, the charge voltage is dialed in. This really annoys me because if the wrong voltage is dialed in, the battery may be damaged or worse yet, a fire starts. Our batteries have been labeled with the "charged voltage" instead of the lower "discharged nominal voltage" The Triton expects the user to dial in the discharged nominal voltage instead of the higher charged voltage. So apparently, batteries have been damaged when this higher voltage is dialed in. I personally think it's a risky design. All our chargers have either jumpers or a knob that has discrete 1, 2 or 3 cell charging. I didn't dream that a manufacturer would use a dial in charge voltage. So the bottom line, if you have our 2-cell pack, set the Triton to 7.4 volts (not 8.4) and if you have a 3-cell pack set the Triton to 11.1 volts (not 12.6). Also just to be sure, charge at 0.5 amp, don't leave unattended and don't charge the battery on a flammable surface. At the above voltage settings, your Triton should be okay.

What are the best battery packs to use?
The best battery packs by far are the Lithium Ion Polymer (LiPoly) packs. The reason is that they are light in weight for their power and flight duration. The two cell 950 Mah packs will power a Mini or a Trainer for 20 to 25 minutes, sometimes more. We also sell a newer generation 860 Mah two cell pack that is a little lighter weight. The IFO Mk3 uses a three cell LiPoly pack because of it's larger motor.

Can I use NiCads or Nickel Metal Hydride packs with the IFO's?
Yes, NiCads and NiMH are heavier than LiPoly packs so you need to use Lower Mah capacity packs to keep the weight down. The biggest drawback here is the much shorter flight times available.

Wild R/C, Inc.

Topic: 2618 Message: 2630

As another data point, I've found that Li-poly batteries are far less tolerant of deep discharge. I did that one time on a bench test accidentally (left it run overnight) and ruined the pack. I attemped to charge the pack at a low rate to see if I could get it back, but the pack began to swell upon charging and never did work again. I have accidentally deep-discharged regular Li-ion cells a time or two and they came back, probably because I (carefully) recharged them the next day. One Li-ion pack was lost by doing a deep discharge and leaving it dead for a week or two.

If you do build a Li-poly pack, include a undervolt protection circuit. Probably a good idea for Li-ion packs too, but I've gone without it so far.

I can only hope everyone is smart enouth to figure out that charging any type of battery can be very dangerous.One of the warnings are Never charge a battery unsupervised.LI-PO and similar are considered as mini bombs.Cell phones use the same type,and burn up just the same.Look at the Dell batts and Apple laptop recalls.Li-ion type were getting over-charged and bursting causing fires.

I have Li-po for my R/C planes. I use the Triton very carefully.Follow the directions with the battery and whatever charger you decide to use,and use caution !!

Caution! when using Triton Charger with our Lithium battery pack
We've had several customers ruin our batteries using the Triton charger. But I think if setup properly, the Triton charger is fine. But, as a precaution at this time, I don't want to hear any more stories about the Triton charger ruining our batteries. I've ordered a Triton charger for my own investigation but here is what seems to be occurring. Apparently with the Triton charger, the charge voltage is dialed in. This really annoys me because if the wrong voltage is dialed in, the battery may be damaged or worse yet, a fire starts. Our batteries have been labeled with the "charged voltage" instead of the lower "discharged nominal voltage" The Triton expects the user to dial in the discharged nominal voltage instead of the higher charged voltage. So apparently, batteries have been damaged when this higher voltage is dialed in. I personally think it's a risky design. All our chargers have either jumpers or a knob that has discrete 1, 2 or 3 cell charging. I didn't dream that a manufacturer would use a dial in charge voltage. So the bottom line, if you have our 2-cell pack, set the Triton to 7.4 volts (not 8.4) and if you have a 3-cell pack set the Triton to 11.1 volts (not 12.6). Also just to be sure, charge at 0.5 amp, don't leave unattended and don't charge the battery on a flammable surface. At the above voltage settings, your Triton should be okay.

What are the best battery packs to use?
The best battery packs by far are the Lithium Ion Polymer (LiPoly) packs. The reason is that they are light in weight for their power and flight duration. The two cell 950 Mah packs will power a Mini or a Trainer for 20 to 25 minutes, sometimes more. We also sell a newer generation 860 Mah two cell pack that is a little lighter weight. The IFO Mk3 uses a

three cell LiPoly pack because of it's larger motor.
Can I use NiCads or Nickel Metal Hydride packs with the IFO's?
Yes, NiCads and NiMH are heavier than LiPoly packs so you need to use Lower Mah capacity packs to keep the weight down. The biggest drawback here is the much shorter flight times available.

2636. OT: Palm TX recommendations

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-30 19:32:25 UTC
From: mconner1@gmail.com
Topic: 2636 Message: 2636

I know this has nothing to do with balloons, but I'm sure a few people on the list use the gizmo....

My wife would like a Palm organizer, and I'm thinking about getting the TX with its WiFi web-browsing capability. We have WiFi at home, and she could use this to check e-mail and limited web browsing without firing up the laptop and having the kids (3 and 1 y/o) all over the keyboard. Plus she could do the same thing at the local Panera or wherever else open WiFi is available.

They run $300 new and like-new used ones seem to be going for just over $200 on eBay. Anyone on the list use them and have good/bad comments? I had a Palm III that I bought for playing around with PocketAPRS several years ago and haven't used them since that generation of handhelds.

Reply off-list so I'm not abusing the good graces of the list users any further than I already have.

2637. Re: [GPSL] Insulation

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-30 21:13:00 UTC
From: PAUL VERHAGE
Topic: 2627 Message: 2637

The charts from my 2 hour flights show the internal temperature dropping to 30 degrees before warming back up again. At balloon burst the temperature drops again for a short period of time. I warp my airframes in MLI, but I don't think we get a hard enough vacuum to make MLI effective. My experiments show that wrapping the airframe in dark colors makes it several degrees warmer.

Paul

>>> Brek Brixius <gofly2007@...> 8/29/2006 11:38:14 pm >>>
To start, I would like to introduce myself to the group. My name is Brek Brixius. I attended GPSL 06. While there, I kind of kept to the shadows. I am currently working at constructing a balloon that I hope to launch in 2007.

Since I have never done this before, I have a lot of questions. What is on my mind at the moment though is, insulation.

At GPSL it seemed like folks were concerned about their packages getting cold and freezing. I am preparing to build my airframe and have been reading some NASA sites about MLI on spacecraft as well as a NASA site regarding balloons. In both cases, they seem to worry about heat - see the following taken from http://topweb.gsfc.nasa.gov/balloon/inside.html

"Balloons can fly to an altitude of 26 miles (42 kilometers), with flights lasting an average of 12 to 24 hours. Special Long Duration balloon flights can last for more than two weeks. When the balloon reaches 50,000 feet, the temperature drops to -70 degrees Celsius (-94 Fahrenheit). However, at the balloon's highest altitude it gets somewhat warmed up by the Sun and the temperature rises to about -40 Celsius (-40 Fahrenheit). Even though the temperature is still extremely low, there are often more concerns with the payload getting too hot than too cold. Since the air pressure is low (1/500ths of sea level pressure), cooling by air works much less well at ballooning altitudes than it does on the ground. So even though the outside air is very cold, it doesn't take heat away from the package very well, so the usual sources of heat (Sun, or the operation of electronics, etc. inside the package) can potentially cause the package to get very hot."

I wonder if they have heat problems do to the longer duration and/or higher altitudes?

Any comments you folks have would be greatly appreciated.

Thanks
Brek.

From: Dominick Marrone
Topic: 2618 Message: 2638

I've researched into several companies Poly-Li battery packs and quick charger products for near space applications, and came across what 'appears' to be a good product, at low cost ...

Q: Has anyone every used, or heard (good or bad) about Poly-Li battery products from a company called www.batteryspace.com (a.k.a. Powerizer)?

They also sell variety of individual "quick" Poly-Li battery chargers, each specific do a specific battery Voltage/Current and # of Cells configuration; e.g. 4 cells, 5-cells, etc.. In addition, their chargers include a special built-in I.C. to prevent over-charge (slow or under-charge?) and reverse polarity connection protection circuitry.

Their products have a look of "good quality" but are priced very competitively, plus their website provides "all" product specs, not just cut-sheets, and plenty of "cautions" regarding over-charging, etc. Unlike the other companies, Powerizer also customizes Poly-Li packs to your need!

Your feedback is greatly appreciated. Thanks.

Hi Harry,

I'm new at this, but I was able to locate you on findu.com, but you need to use the following syntax : http://www.findu.com/cgi-bin/find.cgi?kc5trb

(Note: This syntax is a liitle different from your posted link. If you go to findu.com news, they claim they are tryint out some new pages. etc.

Here is the info returned:

Position of KC5TRB --- 3.0 miles northeast of Tulsa, OK --- Report received 1 days 16 minutes 8 seconds ago
Status: 290052z[224] http://members.cox.net/hhm_74775/ORB
Raw packet: KC5TRB>APS224,ETULSA*,WIDE3-2,qAo,KA5J:=3609.93N/09556.39W- Harry de Tulsa

Also, findu found you on wx.findu.com but says you are not outputing any weather data at this time.

Hope this helps.

Hi Dominic,

I am aware of the various syntax's available on FindU and do use the one you suggested at times. I'm just having problems with the one I listed. It hasn't worked for a couple weeks that I know of. Maybe there has been an overhaul on the syntax. I tried http://www.findu.com/cgi-bin/find.cgi?kc5trb* and it works just fine. This syntax is good to use if you are looking for a station, but don't know what the extension is

Thanks!

Actually, I believe most of those history queries
allow a start, stop, and duration period. You can
change the 'start' as the data gets older (at least
you could), so if you know when the data was
collected, you (use to) be able to query for that
'period'. I'm not sure how long they keep data
anymore, but I think you might look at the syntax for
some of those queries and see what the syntax changes
could be.

2648. Fwd: Air Force Awards $49 Million Contract for Ballon-Borne Near Space Communications

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-31 13:19:01 UTC
From: Joe Lynch
Topic: 2648 Message: 2648

To: GPSL group

From: Joe Lynch, N6CL

Space Data Corporation Awarded $49 Million Air Force Contract For Near Space Communications System

Chandler, Arizona; August 30, 2006-The U.S. Air Force Space Command Space & Missile Systems Center's Development and Test Wing, Kirtland Air Force Base, New Mexico, today announced that it is awarding a $49 Million contract to Space Data Corporation to provide a near space communications system. "Near space" is defined as 65,000 to 135,000 feet above the earth-higher than airplanes fly, but lower than satellites. "Under previous Space Command contracts, the Air Force Space Battlelab carried out extensive testing of our system over the past two years," said Gerald Knoblach, chairman and CEO of Space Data. "We are gratified and proud that the Air Force selected our technology as the next important improvement in battlefield communications."

The Battlelab tests included using the same tactical radios carried by troops in Iraq and Afghanistan. The results showed that ground-to-ground voice and data communications could be extended from 10 miles to over 400 miles using Space Data's balloon-borne payloads. Likewise, the Space Data technology significantly improved communications between troops on the ground and pilots flying air support. Further tests were conducted this year as part of the Joint Expeditionary Force Experiment-a biennial event sponsored by the Air Force Chief of Staff to test the latest war fighting technologies. Additional advantages identified by the military included ease of launch and the ability to quickly adapt payloads for specific warfighter needs.

The Space Data system utilizes a balloon-borne platform that takes advantage of the very predictable winds in near space to position communications equipment 20 miles above the earth. The GPS-equipped platforms can be launched from the back of a Humvee, for example, and once at altitude provide excellent communications over thousands of square miles.

The Near Space Communications System contract is a five-year "indefinite delivery, indefinite quantity" arrangement that permits the Space & Missile Systems Center to order Space Data equipment as needed. Space Data will also provide training in using the equipment for military personnel.

Knoblach explained that a commercial version of the company's technology called a SkySite platform has provided digital communications service to the energy industry for more than two years. The SkySite system operates over the South-central and Southwestern United States and allows energy firms to monitor and control equipment remotely. At 20 miles above the earth, the Space Data technology is well above weather systems. It provided uninterrupted service throughout last year's hurricane season, including Hurricanes Katrina and Rita. For this reason public safety agencies and emergency management officials are also evaluating the advantages of near space communications for domestic uses.

For additional information on the Space Data Corporation, please visit http://www.spacedata.net.

2649. KPC-3 TNC's losing their configs?

Yahoo group: GPSL (2002 — 2008)
Date: 2006-08-31 17:08:04 UTC
From: Zack Clobes
Topic: 2649 Message: 2649

I'm having a problem with my KPC-3 losing its entire config on a regular but not predictable time period. I just replaced the lithium battery so I'm pretty sure I didn't have two bad batteries. It's the same TNC that I've used for years chasing balloons, so I'm sure it's not a defunct unit. It is losing the configuration about every two days or so, apparently when I remove power from the unit and reboot it.

I've really only made two changes to it recently. First, I'm running in KISS mode for some testing I'm doing. Secondly, I'm transmitting posit reports on a regular basis, which I'm normally receive only on that unit.

Any thoughts would be appreciated.

Zack

Don,
A friend of mine had one from somewhere. (Rat Shack, maybe?) Basically,
it had a probe with two carbon electrodes in it hooked to a couple of "C"
cell NiCad's. The idea was that the carbon electrodes would carry lots of
current to the solder joint and the items the carbons touched would get hot,
i.e. solder or wire or PC trace.

I played around with it for a while and decided not to get one for
myself. I can't think of when there isn't a better way to solder.

The tips did cool off fairly rapidly and were not flesh-searingly hot
after a few seconds. I would wait a while before shoving it in a pocket.

I've had much better luck with regular cordless irons actually being
able to solder things.

I'd pass.

2654. Re: [GPSL] Insulation

Yahoo group: GPSL (2002 — 2008)
Date: 2006-09-01 01:36:52 UTC
From: Brek Brixius
Topic: 2627 Message: 2654

I read a NASA document that talked about multilayer insulation efficiency. It said that gas (air) trapped between the layers during manufacture dramatically reduced the efficiency. They were testing 15 layer MLI Their solution was to perferate the layers at regular intervals to allow the gas to escape. I wish I could find the document for you. I thought I had saved it on my computer but can not find it now.

Some other information I came across indicated that Chinese space blankets are of inferior quality. Even so, I am going to try to make an MLI with cheap Walmart spaceblanket and foamies in place of scrim. That is assuming I can find a glue that will flex enough and stick well to both materials. I have a can of spray adhesive I thought might work.

I have started building the air frame. I am using some rather thick (1 1/2") foam beadboard I already have on hand. I am bonding coroplast to each side of the foam (at least on the base and top pallets) with Elmer's Ultimate. I am orienting the veins in the coroplast so that they run perpendicular to the veins on the other side of the foam. This makes a very rigid yet light construction material. They make a similar material for the construction industry that bonds a wood product to foam. Houses can be built from that material very quickly because there is no need for framing and the insulation is already installed.

I am not sure how the weight of this material compares to the wieght of materials other folks are using. Two 10" x 10" pallets, my Garmin 18, Open Tracker 1x, Handy Talkie minus its battery and 4 pvc through tubes 20" in length weighed 1 lb 12 oz. on our digital mail scale.

Funny thing is, it would cost a lot less to ship it 20 miles horizontally than 20 miles vertically.

Brek.

PAUL VERHAGE <paul.verhage@...> wrote:
The charts from my 2 hour flights show the internal temperature dropping to 30 degrees before warming back up again. At balloon burst the temperature drops again for a short period of time. I warp my airframes in MLI, but I don't think we get a hard enough vacuum to make MLI effective. My experiments show that wrapping the airframe in dark colors makes it several degrees warmer.

Paul

>>> Brek Brixius <gofly2007@...> 8/29/2006 11:38:14 pm >>>
To start, I would like to introduce myself to the group. My name is Brek Brixius. I attended GPSL 06. While there, I kind of kept to the shadows. I am currently working at constructing a balloon that I hope to launch in 2007.

Since I have never done this before, I have a lot of questions. What is on my mind at the moment though is, insulation.

At GPSL it seemed like folks were concerned about their packages getting cold and freezing. I am preparing to build my airframe and have been reading some NASA sites about MLI on spacecraft as well as a NASA site regarding balloons. In both cases, they seem to worry about heat - see the following taken from http://topweb.gsfc.nasa.gov/balloon/inside.html

"Balloons can fly to an altitude of 26 miles (42 kilometers), with flights lasting an average of 12 to 24 hours. Special Long Duration balloon flights can last for more than two weeks. When the balloon reaches 50,000 feet, the temperature drops to -70 degrees Celsius (-94 Fahrenheit). However, at the balloon's highest altitude it gets somewhat warmed up by the Sun and the temperature rises to about -40 Celsius (-40 Fahrenheit). Even though the temperature is still extremely low, there are often more concerns with the payload getting too hot than too cold. Since the air pressure is low (1/500ths of sea level pressure), cooling by air works much less well at ballooning altitudes than it does on the ground. So even though the outside air is very cold, it doesn't take heat away from the package very well, so the usual sources of heat (Sun, or the operation of electronics, etc. inside the package) can potentially cause the package to get very hot."

I wonder if they have heat problems do to the longer duration and/or higher altitudes?

Any comments you folks have would be greatly appreciated.

Thanks
Brek.

Hi Don,

I've not used one, but I think they work by running mondo high current thru the joint you're trying to solder thus producing ohmic heat in the metal. Given that it's a good practice to heat BOTH conductors that you're aiming to solder, there's a risk that some of that high current could wander off elsewhere in the circuit and let out unintended smoke.

If you're looking for a cordless iron for field work, I'd recommend getting one of the butane powered irons. Rat Shack (used to?) sell 'em for about $15, and it comes with a torch attachment to boot. I've used it several times to help students repair balloonsats on launch morning, and most recently, I repaired a broken lead on my HT speaker-mic during the '06 GPSL conference!

I agree with most of what was said, the cold heat ones
work only so-so, you have to be good at making
absolutely good surface contact before they work.
If you want a battery powered one (to avoid butane
fumes), there are 2 easy recommendations.
1. The Weller battery powered one uses AA batteries
<http://www.all-spec.com/1/viewitem/BP645MP/ALLSPEC/prodinfo/?gclid=CI3JsK38i4cCFQeqHgodln
DJ6w>

2. The ISO-TIP models, 2C cells, or rechargable
battery pack.
<http://www.iso-tip.com/html/soldering_irons.htm>

otherwise it is a butane one.

Yes, I had an ISO-TIP back before I was in tech school
and after while heavy into hardward. It worked well. I
might have to try to find another one of those, for
multiple reasons. It worked very well. As I recall I
used it to help build my first computer back in the
70s.

Thanks David!

I make my cheap MLI with space blanket and wedding veil material as the scrim. Wedding veil material is a tiny open mesh of plastic and very similar to aerospace scrim. I use solid 3/4" thick Styrofoam for my airframes. The Styro keeps the interior pretty warm by itself. I'd like to see what kind of temperatures you get with corroplast walls.

Paul

Hi Brek,

Considering the components in your payload, 1.5" thick insulation is probably overkill. We fly a similar APRS module using an Alinco DJ-C5 and Rockwell Jupiter GPS engine, plus 3 surplus LiSO2 D cells in a 3/8" thick foamcore housing just 4 x 4 x 6. It's internal temp stays comfy enough to keep things humming thruout a 2.5 hr flight, plus 1 hr preflight and over 4 hrs recovery. With a homebrew 2m J-Pole, it weighs in soakin' wet at 1.7 lb. We use a single 3/8" OD thru tube to pass the payload line thru - this keeps all of the line tension out of the housing, which has crushed at least one payload when we used a yoke harness to the corners.

Note that due to poor free convection coefficient at high altitude, things that dissipate heat and rely on convection to git shut of it can overheat. Heat generators like linear voltage regulators can be keep cozy simply by relying on radiative cooling, which varies as the 4th power of temp difference (and directly with emissivity). So a large, thin Al sheet - even just mill finish - can work fine as a balloon payload heatsink. Note that black anodize has very POOR emissivity at IR wavelenghts over 1 um - raw Al is better and carbon black paint is super.

Mike:

Thank you for your comments.

I know the foam is thick. I happen to have it on hand and need to use it for something. I have already started construction of the airframe and want to see it through. If I think the result is completely unreasonable, I'll try again.

Since this is my first attempt, my thoughts are not necessarily for the lightest possible rig but one that my balloon will lift and will be legal. If I understand right, the legal limit is 12 pounds divided into two modules. I only intend to fly one module and expect it to be under 6 pounds.

My thoughts regarding the interior of the craft are as follows (and if I'm wrong - anybody please chime in): Cold air is outside. Cold air causes batteries to be weak and may cause components to not operate properly. Therefore, keep cold out. Also, air inside should expand like the gas in the balloon. As it expands, it will exit the airframe taking warmth with it or (if I managed a perfect seal - not likely) the airframe might burst. So, I want to minimize the air inside by filling that space (with more foam). Foam in the interior should keep components from shifting about. Also, solid things do not crush as easily as hollow things of the same material. Therefore, pack interior with foam to make it more solid. I know foam weighs more than air. As long as I'm legal and can get it all off the ground - I think that should be ok.

Your 1.7 pound craft is very admirable and gives me something to aspire to in the future. :)

:) Maybe one of my mission objectives will be to have the warmest nearspacecraft interior. First egg fried at 100,000 feet? Or, 50,000 feet. Or, in a foam box in the back of my truck.

Note to self: Have adjustable mission objectives to minimize possibility of failure.

I have been reading some of your material I found on Parallax.com. Thanks. Materials like that really help guys like me who... how should I put this... guys like me who don't know what they are doing.

I am interested to see if I can get warmer inside temps as well. I'm not really wanting to build the Basic Stamp flight computer and haven't had a chance to experiment much with my OpenTracker 1x to see what is involved in getting temperature readings from it.

At this point I have a lot to learn. I basically need one of those big posters they pack in computer cartons that says, "put the purple plug in the purple hole". Except I need a poster like that for ballooning.

Brek.

I read a NASA document that talked about multilayer insulation efficiency. It said that gas (air) trapped between the layers during manufacture dramatically reduced the efficiency. They were testing 15 layer MLI Their solution was to perferate the layers at regular intervals to allow the gas to escape. I wish I could find the document for you. I thought I had saved it on my computer but can not find it now.

Some other information I came across indicated that Chinese space blankets are of inferior quality. Even so, I am going to try to make an MLI with cheap Walmart spaceblanket and foamies in place of scrim. That is assuming I can find a glue that will flex enough and stick well to both materials. I have a can of spray adhesive I thought might work.

I have started building the air frame. I am using some rather thick (1 1/2") foam beadboard I already have on hand. I am bonding coroplast to each side of the foam (at least on the base and top pallets) with Elmer's Ultimate. I am orienting the veins in the coroplast so that they run perpendicular to the veins on the other side of the foam. This makes a very rigid yet light construction material. They make a similar material for the construction industry that bonds a wood product to foam. Houses can be built from that material very quickly because there is no need for framing and the insulation is already installed.

I am not sure how the weight of this material compares to the wieght of materials other folks are using. Two 10" x 10" pallets, my Garmin 18, Open Tracker 1x, Handy Talkie minus its battery and 4 pvc through tubes 20" in length weighed 1 lb 12 oz. on our digital mail scale.

Funny thing is, it would cost a lot less to ship it 20 miles horizontally than 20 miles vertically.

Brek.

PAUL VERHAGE <paul.verhage@...> wrote:
The charts from my 2 hour flights show the internal temperature dropping to 30 degrees before warming back up again. At balloon burst the temperature drops again for a short period of time. From: wb8elk@aol.com
Topic: 2627 Message: 2662

Brek,

The big boys (National Scientific Balloon Foundation) have to worry about heat buildup since they usually go up to over 130,000 feet and stay there all day...plus they usually carry up massive payloads (thousands of pounds) with an array of power hungry electronics that generate quite a bit of heat. Unless you are running a PC104 PC or ATV, the typical APRS payload generates extremely little heat due to the intermittent nature of it's transmissions. In the case of higher power continuous payloads like ATV, I will sometimes put the heat sink fins sticking out of the payload (in the case of 3 Watts or more)....I've had no problems with a 1 Watt ATV transmitter inside a payload.

I like the 2-inch thick styrofoam package that the ozonesondes come in....available for $25 from the manufacturer of the ozonesondes....or something similar (someone at GPSL mentioned that steaks come in a similar package when sent in the mail).

Bill:

I looked at several options before I decided to build my own airframe. One of the things I looked at was an Omaha Steaks cooler that the neighbor was throwing away. It is a very good foam cooler. The one I have is too large for my use though.

Omaha Steaks ships their steaks to their customers in these containers which can be days in transit. They must work. If you don't order as much meat, maybe you could get a more reasonable size cooler. http://www.omahasteaks.com

I also considered cutting the cooler into sections, removing a section and gluing it back together to make it smaller. I may still end up going that way if what I am working on now becomes too heavy.

2665. a few new 9.6 volt, 3800maH NiMH batteries available

Yahoo group: GPSL (2002 — 2008)
Date: 2006-09-02 19:44:15 UTC
From: Hank
Topic: 2665 Message: 2665

I have a few extra of these nice APC (the UPS people) brand
batteries for sale.

9.6 volts, 3800 maH capacity. More specs to see at:

http://www.apc.com/resource/include/techspec_index.cfm?base_sku=LBCCQ1

Looks like a special type of connector, but haven't gotten
a good look at it yet.

Price would most likely be something like mid twenties dollars
plus shipping (from Massachusetts). Less per unit if you'd
like two.

Lots and lots of uses for on or off your balloon. Please post
any questions here, and email to order.

Hank

Hey Bill,

How thick is the material you have? Is it reasonably easy to work with? Also, we are scheduled to fly ARBONET-1 September 30th. Launch time 9:00 AM CDT. I'll let you know how it goes.

73,

Doug, W5BL

2668. Re: [GPSL] Insulation

Yahoo group: GPSL (2002 — 2008)
Date: 2006-09-03 02:21:06 UTC
From: Mike Manes
Topic: 2627 Message: 2668

Hi Brek and Bill,

A prefab styrofoam package can be a neat, fast solution - if you can find one the right size and shape. Ultimately, you're gonna have to do a little carving or cubbyhole stuffing, tho.

Another consideration is one I discussed during my pitch at GPSL 06 re "barn door" vs "low drag" packages, which really can make a difference in how clean your post-burst descent ends up. Larry K0ANI used a 4" fiberglass rocket tube and nosecone from the hobby shop for his ultimate low drag payload. It lacks sufficient thermal insulation, perhaps.

2669. Camera Ports

Yahoo group: GPSL (2002 — 2008)
Date: 2006-09-05 05:15:43 UTC
From: Brek Brixius
Topic: 2669 Message: 2669

I have some 1.3 megapixel digital cameras that I got at Walmart. I have stripped them down - removing the plastic shell, the lcd, the flash cap, flash bulb, piezo, wrist strap. The result is pretty light.

What I am wondering about though is how folks mount their cameras. Do you set them back away from the outside wall and cover with a window? Or do you just poke the lense out the side?

I have done some experimenting with shooting pics through a tube. It looks like if I recess the cams much the opening will need to be rather large.

Brek.

If I can chime in on something Mike just said. My book on the Parallax website describes how I assemble airframes from 3/4 inch thick Styrofoam. It's a free download.

2673. Re: [GPSL] Camera Ports

Yahoo group: GPSL (2002 — 2008)
Date: 2006-09-05 18:52:39 UTC
From: PAUL VERHAGE
Topic: 2669 Message: 2673

I mount my cameras in a box. Some times it's inside the module and other times mounted to the outside. Leave an opening large enough for the lens and any light sensor or focus sensor to see out. Don't put a window over the lens, it's just a surface for condensation to form. I have enough pictures of frost at 90,000 feet to suit me, thank you.

Paul

>>> Brek Brixius <gofly2007@...> 9/4/2006 11:15 pm >>>
I have some 1.3 megapixel digital cameras that I got at Walmart. I have stripped them down - removing the plastic shell, the lcd, the flash cap, flash bulb, piezo, wrist strap. The result is pretty light.

What I am wondering about though is how folks mount their cameras. Do you set them back away from the outside wall and cover with a window? Or do you just poke the lense out the side?

I have done some experimenting with shooting pics through a tube. It looks like if I recess the cams much the opening will need to be rather large.

Hi Doug,

I believe the space station insulation is about a half inch thick....I'll try to get more detailed info on it when I get back home. I'll be back in Alabama the weekend of your flight and will look for it.

- Bill

Subject: RE: [GPSL] Insulation - I have some Space Station insulation

Hey Bill,

How thick is the material you have? Is it reasonably easy to work with? Also, we are scheduled to fly ARBONET-1 September 30th. Launch time 9:00 AM CDT. I'll let you know how it goes.

73,

Doug, W5BL

Subject: Re: [GPSL] Insulation - I have some Space Station insulation

I have a huge pallet of space blanket material that was surplus left over from building the International Space Station (I got it at a NASA auction at Marshall space flight center last year)...each one is about 3 feet wide by 5 feet long....might be worth cutting up for a balloon payload if anyone is interested in trying it.

Subject: Re: [GPSL] Insulation
:) Maybe one of my mission objectives will be to have the warmest nearspacecraft interior. First egg fried at 100,000 feet? Or, 50,000 feet. Or, in a foam box in the back of my truck.

Note to self: Have adjustable mission objectives to minimize possibility of failure.

I have been reading some of your material I found on Parallax.com. Thanks. Materials like that really help guys like me who... how should I put this... guys like me who don't know what they are doing.

I am interested to see if I can get warmer inside temps as well. I'm not really wanting to build the Basic Stamp flight computer and haven't had a chance to experiment much with my OpenTracker 1x to see what is involved in getting temperature readings from it.

At this point I have a lot to learn. I basically need one of those big posters they pack in computer cartons that says, "put the purple plug in the purple hole". Except I need a poster like that for ballooning.

Brek.

PAUL VERHAGE <paul.verhage@...> wrote:
I make my cheap MLI with space blanket and wedding veil material as the scrim. Wedding veil material is a tiny open mesh of plastic and very similar to aerospace scrim. I use solid 3/4" thick Styrofoam for my airframes. The Styro keeps the interior pretty warm by itself. I'd like to see what kind of temperatures you get with corroplast walls.

Paul

>>> Brek Brixius <gofly2007@...> 8/31/2006 7:36 pm >>>
I read a NASA document that talked about multilayer insulation efficiency. It said that gas (air) trapped between the layers during manufacture dramatically reduced the efficiency. They were testing 15 layer MLI Their solution was to perferate the layers at regular intervals to allow the gas to escape. I wish I could find the document for you. I thought I had saved it on my computer but can not find it now.

Some other information I came across indicated that Chinese space blankets are of inferior quality. Even so, I am going to try to make an MLI with cheap Walmart spaceblanket and foamies in place of scrim. That is assuming I can find a glue that will flex enough and stick well to both materials. I have a can of spray adhesive I thought might work.

I have started building the air frame. I am using some rather thick (1 1/2") foam beadboard I already have on hand. I am bonding coroplast to each side of the foam (at least on the base and top pallets) with Elmer's Ultimate. I am orienting the veins in the coroplast so that they run perpendicular to the veins on the other side of the foam. This makes a very rigid yet light construction material. They make a similar material for the construction industry that bonds a wood product to foam. Houses can be built from that material very quickly because there is no need for framing and the insulation is already installed.

I am not sure how the weight of this material compares to the wieght of materials other folks are using. Two 10" x 10" pallets, my Garmin 18, Open Tracker 1x, Handy Talkie minus its battery and 4 pvc through tubes 20" in length weighed 1 lb 12 oz. on our digital mail scale.

Funny thing is, it would cost a lot less to ship it 20 miles horizontally than 20 miles vertically.

Brek.

PAUL VERHAGE <paul.verhage@...> wrote:
The charts from my 2 hour flights show the internal temperature dropping to 30 degrees

before warming back up again. At balloon burst the temperature drops again for a short period of time. I warp my airframes in MLI, but I don't think we get a hard enough vacuum to make MLI effective. My experiments show that wrapping the airframe in dark colors makes it several degrees warmer.

Paul

>>> Brek Brixius <gofly2007@...> 8/29/2006 11:38:14 pm >>>
To start, I would like to introduce myself to the group. My name is Brek Brixius. I attended GPSL 06. While there, I kind of kept to the shadows. I am currently working at constructing a balloon that I hope to launch in 2007.

Since I have never done this before, I have a lot of questions. What is on my mind at the moment though is, insulation.

At GPSL it seemed like folks were concerned about their packages getting cold and freezing. I am preparing to build my airframe and have been reading some NASA sites about MLI on spacecraft as well as a NASA site regarding balloons. In both cases, they seem to worry about heat - see the following taken from http://topweb.gsfc.nasa.gov/balloon/inside.html

"Balloons can fly to an altitude of 26 miles (42 kilometers), with flights lasting an average of 12 to 24 hours. Special Long Duration balloon flights can last for more than two weeks. When the balloon reaches 50,000 feet, the temperature drops to -70 degrees Celsius (-94 Fahrenheit). However, at the balloon's highest altitude it gets somewhat warmed up by the Sun and the temperature rises to about -40 Celsius (-40 Fahrenheit). Even though the temperature is still extremely low, there are often more concerns with the payload getting too hot than too cold. Since the air pressure is low (1/500ths of sea level pressure), cooling by air works much less well at ballooning altitudes than it does on the ground. So even though the outside air is very cold, it doesn't take heat away from the package very well, so the usual sources of heat (Sun, or the operation of electronics, etc. inside the package) can potentially cause the package to get very hot."

I wonder if they have heat problems do to the longer duration and/or higher altitudes?

Any comments you folks have would be greatly appreciated.

Thanks
Brek.

Try applying a clear plastic window over the aperture in the housing,
and it may help to use some Rain-X to keep it from frosting up. You
can test the camera for cold tolerance by putting it in the freezer of
your 'fridge - usually running at zero F or -16C.

I use a thin sheet of Mylar film for my camera window, like for an overhead transparency, plus a bag of desiccant inside payload to absorb moisture, and it's never frosted up. Back when we used a steerable glass mirror to aim the image, we did encounter frost if I didn't apply a fresh coat of exterior (windshield grade) Rain-X.

Jon,

Are you talking about *any* battery, or batteries for
R/C use, or some other qualification to the phrase
"any battery."

Many batteries and battery charging systems operate very,
very safely unsupervised.

Is the warning you speak of something that came with
the Triton or similar charger?

Last Call For Registrations
SmallStat 2006
A conference on Small Balloon Science, Technology and Operations
18 - 19 September 2006

Conference Web Site: http://www.ia.spacegrant.org/smallstat/

This event is open to Researchers, Students, Amateur Radio balloonists
or anyone interested in small balloon activities. Distinguished speakers
from Government (including FAA, NASA, NOAA and Air Force), Industry, and
Academe will present in plenary session. The AIAA Balloon Technical
Committee will hold a meeting in Ames, Iowa in conjunction with this
event.

The event includes a STUDENT POSTER SESSION with a top prize of $1000
plus a balloon from Global Western, $750 2nd place, and $250 3rd place.
A huge corporate recruiting event with over 300 companies is held in
conjunction with this event.

Prize Drawing for Amateur Radio Operators to win a Balloon from Global
Western

Please broadly distribute this announcement and encourage attendance.

I hope to see you and your colleagues there.

Bill Byrd

Troy,

Thanks for keeping up on these devices and letting us
all know what's going on.

What is very interesting is that the IC is about $12,
so that means we've got a nice datalogger for about $22
if we can get our own boards designed and built.

I don't think that's a big "if."

Hank

From: PAUL VERHAGE
Topic: 2680 Message: 2688

I use the ones with the internal temp and an external voltage. The external voltage is hooked up to a thermistor for external temperature sensing.

I'm playing with a Hobo that also records RH. I'll cut a hole in the airframe over the RH sensor and get the air RH.

I have used a four external channel Hobo for myself. You'll need to make (or buy) all four of your sensors for that one.

The Hobo uses a 3/32" stereo jack. That provides 2.5 V power, a ground, and voltage input. My early articles in Nuts and Volts gives the pin out and some suggested sensors.

I'm leaving for Iowa in a few minutes, so I can't look it up for you. But if you go to my book on the parallax.com site, they've started PDf'ing my N&V articles.

My next article is on a BalloonSat flight computer that you can use in place of a Hobo. After that I'll write about my PongSat flight computer.

2694. FAR 101 line strength

Yahoo group: GPSL (2002 — 2008)
Date: 2006-09-30 15:54:07 UTC
From: K. Mark Caviezel
Topic: 2694 Message: 2694

Will:
Be careful on how your read part 101. It makes no reference to tensile strength:

<excerpt>:
(iv) Uses a rope or other device for suspension of the payload that requires an impact force of more than 50 pounds to separate the suspended payload from the balloon
<end excerpt>

I've conducted a certain amount of research, and have not found a definition of 'impact force'. Many experienced ARHABians know that 50 lb tensile is not sufficient to keep a 6 pound payload attached to the parachute during the first ten miles of fall. If anyone here can point us all to a definition of impact strength, many of us would be in a better position to comply with part 101 exempt status. The alternative of course is to apply for a waiver to Part 101 requirements, or fly Part 101 compliant, but non-exempt. To fly 101 compliant, but non-exempt, file a hi-ball report 6-24 hours before the flight as detailed in 101.37. The regulations are pretty simple, but in my experience many 'local FAAs' have different interpretations, many will try to force you to file for a waivered flight even if you intend to operate the flight with no deviations from the regulations. I have always been an advocate of uniform compliance to the official, published regulations.

FAR 101 Line Strength
Posted by: "Holmes, Will"
wlholmes@...
wlholmestu Fri Sep 29,
2006 8:00 pm (PST) You
mentioned 110 pound kite string, and that made me think of something I have been wondering about for a while. FAR 101 states has something about the test strength of string connecting packages. I believe the strength it states is 50 pound test.

How do the different groups interpret this and what
do you use?

Will Holmes

Subject: [GPSL] I'm a HAM!

Last Sunday I took the technician exam. I am now Brek
KC0YOE. My wife had been listening to me as I
studied. I read out loud to improve retention. She
decided she had listened well enough that she wanted
to take the test as well. She is now Angela KC0YOF.
:)

When I'm read then I can start working on the balloon
tracking system. Recently I have been flying one of
my cameras from a kite. I have 7 foot delta conyne.
Some of the KAP sites recommend a bigger kite. In
winds like we had today, the 7 footer is big enough.

My line was humming like something from a sci-fi
movie. Towards dusk a couple of bats came out and
flew around the line for several minutes. That was
fun to see.

By the way, I have a bunch of 110 pound dacron kite
string. Is it any good fo r the balloon or what sort
of line do I need?

Brek.

Congrats on getting your ticket, Brek! I hope you'll find ham radio to have far more fun and interesting aspects than just for ARHAB.

Re dacron cord: It's probably useful for balloon flight strings, but it's not nearly as "stretchy" as nylon. This means that line tension can soar under acceleration, as during launch and in particular post-burst chaos. I got a roll of if from U Wyo's retired balloon program, marked "DON'T USE" for that very reason. And EOSS has experienced a couple of line separations in flight - dacron cord was in use in both cases.

EOSS uses woven nylon cord - the 250# tensile cord is sold as kite string, while the 500# stuff is used for our heavy flights. We've never encountered a line break with that stuff.

Hi Will,

FAR 101 stipulates "impact force", not tensile strength. From
FAR 101.1.a.4:

(iv) Uses a rope or other device for suspension of the payload that
requires an impact force of more than 50 pounds to separate the suspended
payload from the balloon.

That term is also used in 101.35 referring to trailing wire antennas.

I've never found a technical definition for "impact force", but the term
does imply some dynamics rather than the static conditions where tensile
strength is evaluated. The object of this requirement is ensure that
a balloon flight string will sever in the event of a collision with an
aircraft. I've swagged the impact acceleration in such an event to be well
in excess of 10 G's - meaning that 500# tensile cord should meet that
requirement.

Now, folks who have used 50 lb tensile strength cord on normal ARHAB
payloads have (or will) experience the disappointment of seeing their
balloon soar skyward, unburdened by the payload string remaining on the
surface.

Yup,
we (ARSAT) learned the hardway. On our 2nd flight of last year, the
balloon kept going up while the payload dropped after just rose 100 feet
or so off the ground. I might still have the video if there is a plan to
create an "ARHAB Blooper Video" ;)
Since then we used a much stronger nylon cords.

2698. RE: Bat Cams & Picavets

Yahoo group: GPSL (2002 — 2008)
Date: 2006-10-01 05:41:40 UTC
From: Brek Brixius
Topic: 2691 Message: 2698

I hadn't thought about the bat cam attracting bats. Makes sense.

I have seen the bat cams on ebay for cheap. I wouldn't recommend them for snapping pics for the family photo album but I have been getting a lot of mileage out of them.

I took my first one to work and let it snap pictures during our open house. Kind of fun to cycle through the pics like drawings on a flip pad.

The kite rig has been reconfigured several times. It has bounced of the ground when the kite took a sudden nose dive and it has been dragged through the brush. It has kept working so far (knock wood).

Originally I had the bat cam tied in-line with the kite string through holes in the printed circuit board. I got a few good pics that way but most were blurred. Recently I built a simple picavet for it. I took the picavet out today to test it but the winds were light and variable. I was only able to keep the kite aloft for a short while. Still, the picavet looks promising. Most of the pictures it took today were clear and a few were only slightly blurred.

Basically the picavet lets gravity level that camera platform. The two center lines are held close together by a small ring to minimize rotation. I wonder if this sort of suspension would be of any use on a balloon?

Anybody get blurry pictures on the way up?

Brek.

Roger Hammond <rahammond@...> wrote:
Brek,

Congratulations on you and your wife getting your Tech Licenses!
I use 200 lb. Spectra kite line and haven't had any problems, however, it may a little over-kill.

Were the bats threatened by the Batman camera? ;-)
Seriously, after you mentioned the inexpensive Batman cameras you were using, I went to Wal-Mart the next day to see if they had any. All I could find were some pink princess cam's, I opted to not purchase one.

Thanks to everyone for their comments on line strength. Just to clarify, as I read it - it FAR 101 doesn't say you can't fly line stronger than 50#. It just says that if you do - 101 applies to you. I think I will probably use Spectra line rather than the dacron I already have.

101.1 Applicability.

(a) This part prescribes rules governing the operation in the
United States, of the following:
.
.
(4) Except as provided for in ?101.7, any unmanned free balloon
that-
.
.
(iv) Uses a rope or other device for suspension of the payload that
requires an impact force of more than 50 pounds to separate the
suspended payload from the balloon.

As I recall, it's the breaking strength between the balloon and line that must be 50 pounds. I don't know over what area it must be applied, but I would think the balloon nozzle will shear off with 50 pounds of force.

My cameras are mounted directly to the airframe. The only time I get blurring is at launch. After that, the motion settles down. Oh, right at burst is another time I can get blurring. At that point, all Nevada breaks loose. It's interesting with digital cameras. I don't get blurring, I get distortion.

Hi Don,

Dang! Sorry to hear you lost your payload! But if someone did pick
it up, they might be kind enough to get it back to you. I've heard
that some 80% of NWS radiosondes actually get mailed back by folks
who find 'em!

Re the GPS NMEA altitude data: I'm not familiar with the Garmin GPS18lvc,
but the NMEA sentence you want is $GPGGA, which includes MSL altitude
in meters, plus lat/lon, GPS time hhmmss, no. of sats in track and
VDOP. It's really all you need for balloon tracking, although the
$GPRMC sentence also includes GPS date yymmdd, lat/lon, rcvr status and
course/speed - but no altitude.

We've always flown "exempt", which we read to mean that your load-line must break with 50 pounds of force. Unfortunately they don't really specify what that force is.

I don't think that a balloon would stand a chance if it got snagged up on a jet - it'd rip it to shreds.

However, on a single-engine light plane, I'm not so sure that the balloon would rip apart. I've seen some of those envelopes take quite a beating on the ground and during lift-off. In a worst-case scenario, I think I small Cessna or the like could probably take a flight string for a ride, and I'm not sure that the landing would be very graceful. Catching a balloon on the wing would add a lot of additional drag and severe yaw to the flight, that may not be controllable throughout landing.

We've flowing 50lbs test line on ALL flights. And we have actually had a failure.

During a winter morning launch in about 20mph wind, I had tied up a 50lbs "weak link" in the load line. It was the same mono-filament string that we had used on nearly a half-dozen other flights with no problems, but for some reason in the 25F, brisk morning wind, the line became extremely brittle - it was literally crumbling in our hands. We tried re-tyeing it and launching, but the balloon snapped away and left the payload on the ground.

At that point, we switched to Kevlar "Spider Wire" for our link, and have not had a failure since.

We actually flew mono-filament, paralleled by Kevlar for several flights after the failure until we became comfortable with the new line. None of the mono-filament ever failed again. The only thing I can attribute the one-time brittleness to was that it must have come in contact with some chemical while it was being prepped for flight. The same reel has/had been used for 7+ flights, had been used as guy-wires on my HF mobile antenna for 3+ years, etc.

My opinion, don't try to bend the rules to save a few bucks or a few minutes.

2705. Re: [GPSL] FAR 101 Line Strength

Yahoo group: GPSL (2002 — 2008)
Date: 2006-10-03 02:49:03 UTC
From: Brek Brixius
Topic: 2692 Message: 2705

Zack: Could you please explain what it means to fly exempt?

Pardon me if this sounds like a dumb question. I have a lot of dumb questions. I would rather ask them and learn than remain ignorant. I want to construct a balloon that meets all the regs and will be safe and successful and not harm anyone or anything. If it takes more time or money, fine.

I am wanting to be ready to fly my balloon at GPSL 2007. I have a long ways to go to meet that goal. I really appreciate everyone's help and input.

Even though I am a long way from completion, the balloon project has been great fun. I've learned a lot about electronics, acquired an new hobby (Kite Aerial Photography) and taken tons of photos of everything from dirt to the sun. I have earned an amateur radio license and so has my wife. I have used a temperature logger I bought for the balloon to graph the overnight low temperature in my pumpkin patch and I learned more about how plants react to cold. Even if I stop now, I think it has been well worth my time.

But I don't want to stop. I want that photo of from the top shelf. So look for me at GPSL 2007. :)

One more thought I have about line strength is, these products list a test weight - say 50#. To me that says, the product (or a sample of it) was tested at 50# and did not break. I used to work for a factory that produced a product that was 100% tested and the certified test rating was approx. 1/3 of what nearly all of the product would actually endure before failure. I don't know exactly why they set the test ratings where they did. It would make sense to do so as insurance against failure. You can't sell product that failed the test. So you can't afford to have product fail the test. A failed test might endanger your workers or damage your equipment. The amount that the product will take over test is insurance against law suits. If your product routinely performs to the limits of its spec. you get a reputation for delivering a quality product and you can charge more for it. For whatever reasons, I suspect line/cord manufacturers may also state a test rating that is low.

Brek.

Zack Clobes <zclobes@...> wrote:
We've always flown "exempt", which we read to mean that your load-line must break with 50 pounds of force. Unfortunately they don't really specify what that force is.

I don't think that a balloon would stand a chance if it got snagged up on a jet - it'd rip it to shreds.

However, on a single-engine light plane, I'm not so sure that the balloon would rip apart. I've seen some of those envelopes take quite a beating on the ground and during lift-off. In a worst-case scenario, I think I small Cessna or the like could probably take a flight string for a ride, and I'm not sure that the landing would be very graceful. Catching a balloon on the wing would add a lot of additional drag and severe yaw to the flight, that

may not be controllable throughout landing.

We've flowing 50lbs test line on ALL flights. And we have actually had a failure.

During a winter morning launch in about 20mph wind, I had tied up a 50lbs "weak link" in the load line. It was the same mono-filament string that we had used on nearly a half-dozen other flights with no problems, but for some reason in the 25F, brisk morning wind, the line became extremely brittle - it was literally crumbling in our hands. We tried re-tyeing it and launching, but the balloon snapped away and left the payload on the ground.

At that point, we switched to Kevlar "Spider Wire" for our link, and have not had a failure since.

We actually flew mono-filament, paralleled by Kevlar for several flights after the failure until we became comfortable with the new line. None of the mono-filament ever failed again. The only thing I can attribute the one-time brittleness to was that it must have come in contact with some chemical while it was being prepped for flight. The same reel has/had been used for 7+ flights, had been used as guy-wires on my HF mobile antenna for 3+ years, etc.

My opinion, don't try to bend the rules to save a few bucks or a few minutes.

PAUL VERHAGE wrote: As I recall, it's the breaking strength between the balloon and line
that must be 50 pounds. I don't know over what area it must be applied,
but I would think the balloon nozzle will shear off with 50 pounds of
force.

Paul

>>> "Holmes, Will" <wlholmes@...> 9/29/2006 8:53 pm >>>
You mentioned 110 pound kite string, and that made me think of
something I have been wondering about for a while. FAR 101 states has
something about the test strength of string connecting packages. I
believe the strength it states is 50 pound test.

How do the different groups interpret this and what do you use?

Subject: [GPSL] I'm a HAM!

Last Sunday I took the technician exam. I am now Brek KC0YOE. My wife
had been listening to me as I studied. I read out loud to improve
retention. She decided she had listened well enough that she wanted to
take the test as well. She is now Angela KC0YOF. :)

When I'm read then I can start working on the balloon tracking system. Recently I have been flying one of my cameras from a kite. I have 7 foot delta conyne. Some of the KAP sites recommend a bigger kite. In winds like we had today, the 7 footer is big enough.

My line was humming like something from a sci-fi movie. Towards dusk a couple of bats came out and flew around the line for several minutes. That was fun to see.

By the way, I have a bunch of 110 pound dacron kite string. Is it any good fo r the balloon or what sort of line do I need?

Brek.

> > number all over the flight package.

Maybe the addition of some dollar rewards would help? The ARSAT (Texas Tech ARC) balloon had $$$ rewards written all over the package. Never put that in use though (recovered all, even the one that had triple failure, lost the 915 MHz GPS serial link on descent, lost APRS on ascent, and no backup beacon, after the battery dislodged during a bumpy take off due to a sideward wind gust).

A side note, we lost the first balloon, when we're still clueless and didn't put the $$$ sign.

2707. APRS Test

Yahoo group: GPSL (2002 — 2008)
Date: 2006-10-10 04:33:24 UTC
From: Brek Brixius
Topic: 2707 Message: 2707

I just did my first on air test with my APRS gear.

I'm running pacterm in DOS mode on an old Toshiba Satellite Pro 430CDT. The Toshiba is connected to a Kantronics KAM all mode TNC Rev. 8.2 on COM1. I have my Radio Shack Pro 50 scanner attached as the receiving radio. I am running in DOS mode and I set pacterm to COM1 at 1200bps.

For the tracker I have tried a Tiny Trak3Plus, Garmin Etrex and Alinco DJ-180 2 meter handytalkie. I also tried an Open Tracker 1x, Garmin GPS 18 and DJ-180 combo.

I was indoors do to cold and rain and the etrex could not acquire a fix on the satellites. I had configured both trackers prior to use with my call sign. In the open tracker I added a comment line that says "This is only a test." I also configured the open tracker to report a fixed long. and lat.

Results: Both trackers transmitted at the prescribed interval. Both were received and text was displayed on the laptop screen. However, I'm not sure if what I'm looking at is right. I can read the long. and lat. I can read the comment line. The information at the start of each transmission though looks like garble - upside down question mark, heart symbol, exclamation point, etc.

Anybody got an idea what I need to tweak? I'm thinking it must be close or I wouldn't be able to read the lat. long. I hate to change something and mess it up.

Any help would be appreciated.
Thanks.

Hi Brek,

Sounds like you have the TT3 and OT set to send the compressed MicKey
APRS format - it's NOT human readable. You'll need APRS-SA or UIView
and a mapping app running under Windoze (or Linux?) to see those positions
graphically.

Suggest you reconfig the trackers to report in ACCII NMEA or readable
APRS to get lat/lon and altitude data in a readable format for DOS.

Brek,
If you are stuck with using dos then you may wish to try APRSdos
available free at TAPR. It decodes the compressed formats very well and will
run on about any dos machine back to 8088's. Somewhat crude by Window
standards but does work.

2710. Re: [GPSL] Re: APRS Test

Yahoo group: GPSL (2002 — 2008)
Date: 2006-10-12 03:10:18 UTC
From: Brek Brixius
Topic: 2707 Message: 2710

Well I'm not stuck with DOS. I just want to see the GPS position data in human readable text. I did look at the APRSdos you suggested. For some reason it sent my laptop into a beeping fit. I am also not using Pacterm anymore. I have switched to the UI-View 2.39 16 bit windows version.

In UI-View's terminal window with the etrex/TT3 combo this is what I get now.
01:49:20R KC0YOE>APT311,WIDE1-1,WIDE2-1 <UI Len=27>: !000.000/0000.000>000/000

I have tried nearly all of the various interface options on the etrex. The etrex was on, clear view of sky, lock on satellites, connected to the TT3 with the cable I bought when I bought the tracker. Any ideas.

On the other unit (my open tracker rig), I can get temperature and fixed position readings fine. Once I tell the OT1x to use GPS position instead of fixed and tell it not to transmit if it doesn't have a fix on the satellite, It doesn't transmit.

I bought the OT1x assembled and the Garmin 18 hockey puck with connector together. It should have been ready to use but, to me it looks like the GPS 18 is not getting power or, is not configured properly or does not work. I have no idea how to configue the GPS 18 if it needs to be, since it didn't come with software and doesn't even have an led to indicated it is alive.

I went to the local ham club and asked if there is anybody doing APRS in this area and there isn't. There is one fellow who did packet years ago but doesn't remember much. He has his equipment in storage and said he would try to set it up if he finds the time. I'm hoping he does. I'd like to do some packet chat.

Anyhow, I traveled about 8 hours one way to attend the Ak Sar Ben ARC hamfest last weekend in Omaha because they had an APRS forum on the schedule. I was hoping to figure something out there. It ended up they did not have the forum. Instead they had a Dx forum. It was still fun and worth the trip but, didn't solve my problem.

So, today I ordered the APRS book from ARRL. I'm not sure it will solve my problem either. But it can't hurt right?

If you can think of anything else I should try, let me know.
Thanks for everything.
Brek.

a couple of points here.
1. The Garmin GPS 18 can talk in either Garmin format, or NMEA format for the 18PC and 18LVC formats (Garmin sells 3 different types of GPS18). There is a tool on the garmin website that will allow you to configure which one you send. You should also let us know what ends the GPS18 has (if you have bare wires, it probably does TTL level data out instead of RS232)
2. There are freeware NMEA decoders out there, use one of them to insure your GPS is sending valid data to the system. I use VisualGPS <http://www.visualgps.net/VisualGPS/> or NMEA agent <http://www.iliketheinternet.com/gps.html>
3. If you think the Opentracker is not decoding valid GPS data you can get good support from the opentracker support forum, Scott usually replies within a day. If you can, try to record a text log file of your GPS, and send it in there. <http://groups.yahoo.com/group/opentracker/>
Hope this helps

Sorry - the GPS18 is model GPS18 LVC, 5m. I went to Garmin.com to look for config software but, I got the following message after getting into the download area and requesting the file.

Internal Error 500:
The server hosting the URL you have requested has reported an error. It cannot retrieve your document due to server-side problems.
Please use the links or search feature on this page to continue browsing

At any rate, I am addressing the GPS18 LVC, 5m problems with the open tracker group. I ordered it from Scott and he installed the connector so, I don't know how it is wired or anything. I just got a black hockey puck in a box with no docs, software or whatnot. Since I have no experience with configuring GPS units it is a little intimidating. Kind of like an alien artifact. I'll keep after it and see if I can figure out it's secrets.

Thanks.
Brek.

Brek is making good progress with his GPS18 with assistance
from the <open tracker> group. He's now getting his GPS
output displayed on Hyperterm which is always a simple but
effective starting point.

Thought GPSL group would like to know the above.

Hi Scott,

I can't be there to lend a hand, but I do suggest that you fly a minimum of two beacons, with one being a DF beacon with at least a 50% duty cycle. APRS trackers have been known to fail in flight, especially those that have never flown before. Might also consider flying both APRS trackers as well, along with the DF beacon. You'll probably be using the DF beacon as your primary during recovery, since it's easy to drive right past an APRS beacons between packet frames.

Hi Scott,

I think you'll find the DF beacon useful even in open terrain; we sure do even in the wide open spaces of E. Colo. Unless we have trackers in visual range of the descent and landing, the DF beacon is our primary tracking source for recovery. Our trackers using yagis like to hear a 30-sec DF signal with a tone well apart from 1 KHz so the Doppler DF guys won't get weird results. It takes time to get an accurate DF bearing.

Not sure why you're looking for a radar reflector. It's not required by FAR-101 for exempt flights, and the FAA rarely uses primary radar returns any more. For our heavies, we get an FAA Form 7711-1 waiver that, among other things, exempts the radar reflector. You'd be better off using that weight for a 2m DF beacon.

Denver Center has come to love getting our real-time APRS reports via findu.com. It's the next best thing to a Mode C transponder. I've cc'ed Russ KB0TVJ, who can tell you how to get your beacon reflected in VOR radial/range terms and how to tell the FAA the URL and operation tricks.

2718. FWD: Announcing the Micro-Trak 300

Yahoo group: GPSL (2002 — 2008)
Date: 2006-10-31 13:38:26 UTC
From: mconner1@gmail.com
Topic: 2718 Message: 2718

This should be a kick-butt unit for balloon work. Ideally it would have an alternate frequency available, but for $125 this is a great contribution to APRS.

One could take the transmitter module and apply signals from other sources, I imagine, but I don't believe the transmitter board is available by itself (yet).

==========

Announcing the Micro-Trak 300
Posted by: "Byon Garrabrant" byon@...
Mon Oct 30, 2006 2:41 pm (PST)
VHS Products and Byonics are proud to present the newest generation of integration between TinyTrack and miniature transmitter technology.

The Micro-Trak 300 marries a TinyTrack3 SMT controller and a 300 milliwatt crystal-controlled transmitter, operating on 144.390 MHz. The Micro-Trak 300 measures only 1 X 3 inches and weighs less than one ounce, including the TinyTrack SMT! The Micro-Trak 300 requires only simple final assembly, and due to the fact that it uses a sealed, metal can RF section, no tuning is required. The Micro-Trak 300 is a motherboard for the TinyTrak3 SMT, which can be attached using a socket or soldered directly to the Micro-Trak 300. This is ideal for portable and airborne applications.

Check out: http://www.byonics.com/microtrak300 for more information.

I think it might be pretty easy to add an alternate
crstal that could be selected by a movable jumper, or
if there is a concern for mechanical integrity during
flight, a solder bridge.

Would have to see the circuit to be more definitive
about the above notion.

Hank

MC> There is some discussion of this issue on the TinyTrak group,
MC> however, it appears to involved custom SMT crystals and would
MC> be MC an outright replacement rather than a switchable config.
MC> They are thinking about a production run for 144.80 MHz to
MC> support Europe APRS.

Here is one exact statement from that group:

------------begin quote from "Allen", VHS Products--------

I am leaning towards doing a small run of modules on 144.800
and see where it goes, <snip>

-------------------end quote-----------------------------

MC> I dunno if we have enough market to make a 144.34 MHz
MC> production run worthwhile.

Note that the above statement from VHS is about a
"small run."

Even if doing 144.34 is not economically attractive to *VHS*,
it doesn't preclude us from our own hack, including a
2 crystal config.

HAB is not supposed to be about appliance operating, although
of course it's nice to have stuff ready made. It's NICE, but
not a NECESSITY.

Hank

Mike,

The prior unit carried by TT which gained some notoriety for
a short time was a PLL design, and the PLL IC was discontinued.

This circuit appears to be less complex as far as external
parts are concerned, and probably isn't PLL-based, but I
couldn't be sure just by looking at the images available so
far.

I would think that the IC used will not remain a secret for
long.

Hank

2726. Re: [GPSL] Re: FWD: Announcing the Micro-Trak 300

The old PocketTracker just used a standard VHF PLL. I've noticed that
it's increasingly difficult to purchase PLL's in the lower frequency
range, at least without using lots of discretes.

Most of the PLL's are moving up into the 300-500MHz range or higher.

Byonics is a better description (TT is for Tiny Trak).

2728. BUNS project update

Yahoo group: GPSL (2002 — 2008)
Date: 2006-11-03 04:30:18 UTC
From: Brek Brixius
Topic: 2707 Message: 2728

Hank and Group:

I ended up sending both my trackers back to their makers. Byon discovered that something had changed from his version of the Etrex to Mine. It was an easy fix. He told me what wires to swap and where to jumper and I have a working tracker :).

Scott said the OT1x I sent back worked for him (after he fixed the voltage regulator I destroyed). He returned it to me. I'm still not able to get it to transmit unless I tell it to ignore the GPS lock. I'm not sure why. If nothing else, I figure I can use it as a beacon.

My original airframe concept was a styro-cube with coroplast armor exterior and 4 through-tubes (one in each corner). I covered the coroplast with black foamies with a space blanket ring around the middle. It looks sharp but weighs over 3 pounds without any electronics. So, I am abandoning this design which I refer to as Skytanic.

I have a new airframe in design that I am really liking. It looks like it will shake out much lighter and be easier to reconfigure as well.

I bought a couple of log tags for temperature sensors. I was thinking one for internal and one for external. Now I'm thinking a log tag for external temperature logging and the OT1x beacon will send temperature data for the interior temp.

I bought a lighter radio. An Alinco DJ-S11. It is handy for listening to the local net and I have been carrying it in my shirt pocket. It doesn't have much transmit range though. I hope changing the antenna will improve it a lot. The plan right now is to fly the DJ-S11 with a roll up j-pole.

The local HAM club asked me to give a presentation for them. I showed them videos A and C from NSTAR's 2003 season DVD. Mark was kind enough to send that to me a few months ago. The guys enjoyed it very much. I chose to show them video C because it had landing footage. I think that put a lot of folks concerns to rest. Thanks Mark for sending the Video :).

I have a ballistic nylon parachute on order from rocketman. I was not sure what size since I don't know exactly what I will be flying yet. Their suggestion was to order a larger size than I thought I needed and they have some sort of ring that slides up the lines and pulls the chute edges in. I am aiming to keep my new airframe under 4 pounds loaded. I think I ordered a 6 foot chute. I hope it will work.

I haven't been spending all my time on the balloon project. Matter of fact, I have been spending a lot of time listening to HAMs on the CQ-100 from QSONET.COM. If you haven't seen it, you should. It's a virtual HF rig. Really cool and you can try it free for 90 days.

73 everybody.
Brek.

Hank <n1ltv@...> wrote:

Brek is making good progress with his GPS18 with assistance
from the <open tracker> group. He's now getting his GPS
output displayed on Hyperterm which is always a simple but
effective starting point.

Thought GPSL group would like to know the above.

Hank

We have the perfect Group for you. Check out the handy changes to Yahoo! Groups.

2729. Re: [GPSL] BUNS project update

Yahoo group: GPSL (2002 — 2008)

From: Mike Manes
Topic: 2707 Message: 2729

Hi Brek,

Glad you got your APRS module working OK.

Re the payload support. The 4-tube scheme works well, especially if
you have just the one payload, and the 4 support lines provide torsional
coupling to the parachute shroud lines.

But if you plan on carrying any other stuff lower on the string, especially
if it's heavy, then a single support tube thru the center works well,
since none of the payload line tension stresses the upper payload
structure. Separating payloads also does wonders for EMC problems, like
3rd harmonic of a 70cm ATV xmtr desensing the GPS receiver front end.

I think you'll find that a 300 mW beacon signal will be plenty strong
during flight - it is written: "Line of sight is a magic thing." It
may be a bit puny once the antenna is lying on the ground after landing,
however. One of our old-time members developed a self-erecting 2m ground
plane that keeps the radiating element aloft after landing, and the
trackers LOVE it! The only payload we've used it on is the crossband
repeater, tho, since it works only if the antenna is at the bottom of
the flight string. There's a pic on www.eoss.org somewhere under the
Hardware button on the home page. Be SURE to use RG-142 coax - PVC jacketed
RG-58 embrittles in the cold.

2730. GPSL Update

Yahoo group: GPSL (2002 — 2008)
Date: 2006-11-06 20:34:57 UTC
From: Zack Clobes
Topic: 694 Message: 2730

The GPSL surveys finally stopped filtering in, so I compiled the list of results. The results can be found on the GPSL website (www.superlaunch.org) and it's certainly some interesting reading.

Several people were less than satisfied with the hotel accommodations, and the little bit that I saw of it, I can't entirely blame you. The Grand Prairie mailed me a questioner regarding our experience, and I'll be passing along a copy of our survey with the appropriate comments highlighted.

Overall, I think people were happy with the event, and the last two graphs support that position.

For the astute readers, you may also notice that, by request, is a GPSL hosting guide on the bottom of the GPSL website. Inside you will find 15 pages of the most graphic details about the Great Plains Super Launch ever assembled. Enjoy!

Did Stepheny get them all?

If not all gone, I would be interested in 1 or 2.

2738. GPSL 2007 conference location

Yahoo group: GPSL (2002 — 2008)
Date: 2006-11-17 19:31:15 UTC
From: Roger Hammond
Topic: 2738 Message: 2738

I've been checking on conference room availability and pricing here in Grand Island for GPSL 2007 on July 7. It looks like we have basically two options. The Holiday Inn Mid-Town and the Howard Johnson Riverside Inn.
Holiday Inn's conference room rents for $175 and the Howard Johnson rents for $50. The Holiday Inn is the nicer of the two, but the customer service at Howard Johnson was by far more appealing.

Both establishments have sufficient audio/PA systems, but no video projector. They both offered to rent one for $75. Both have free wireless internet access throughout.

I'm leaning toward the Howard Johnson in an effort to keep the cost down for everyone.

If folks are interested in staying at a different hotel, other than where the conference is being held, Grand Island offers most of the basic chains all within about 15 minutes of the conference location.

A hospitality room is possible if anyone's intersted, it was a little pricey at the Holiday Inn, and the Howard Johnson said they have two adjoining guest rooms they could rent us for that purpose, I don't believe I received pricing on that.

Let me know your thoughts, I'd like to secure a room early next week.

Thanks,

73 de Roger KC0MWM

How do the prices for the hotel rooms compare? What about location and food availability?

Room pricing:

Holiday Inn - $75-80
Howard Johnson - $69.95

Food availability...
For the lunch break during Friday's conference, both hotels have facilities to provide us lunch. They both have restaurants, but the Holiday Inn's is not open for lunch to the public. The Howard Johnson said their restaurant couldn't handle 50 of us showing up all at once, but could cater it to us in an auxiliary room. Average price for lunch at either hotel $10.

I told both places to expect 50 - 100 folks, seated classroom style like we were in Hutchinson.

As for the projector, I was hoping to rent one locally or borrow one if I can find some kind soul.

Wood River and Aurora were the two places I was planning on for a launch location, or possible the Central City airport.

Rog KC0MWM

--- In GPSL@yahoogroups.com, mconner1@... wrote:
>
> The HJ deal sounds pretty good. What's the seating capacity?
> We might be able to get someone on the list to bring a projector and save that rental cost, but that also runs the risk of that person not being able to come at the last minute. Probably worth the extra cost to rent one, unless someone there in Grand Island can get one for free.
> I know it's early, but are you planning to use the school at Wood River for the launch site? That's only 10-15 mi from Grand Island, so it won't mean an unreasonable drive in the morning. A launch site east of Grand Island (Aurora?) will probably need to be scouted too.

That wouldn't be bad idea, except that particular Subway has had some problems recently. I used to eat there every Friday, the wait time got to be too long and there were people there to pick up sandwiches they had ordered hours before that hadn't even been made yet. The restaurants at both hotels have good food...at least the last time I ate at either one, they were both good.

Rog KC0MWM

What if we arranged for everyone to put in a sandwich order on arrival Friday morning that we could fax over there, then pick up the sandwiches and bring them back to the hotel and eat at the conference location? That may work better than a fleet of cars driving downtown and descending on one restaurant for lunch. Pop and chips could be supplied separately (cheaper that way).

I'd vote for the HJ. Yahoo Travel has mixed opinions about the place,
but nothing terribly bad.

If they cater, will we be able to do a dutch ticket?

As for the projector, I'd be more than happy to bring one, but like Mark
said, that's an uncertainty that I, as an organizer, wouldn't want to
have to deal with. One place you may be able to beg/borrow/steal from
may be a local church.

I'll find out about the dutch ticket. There are a couple of options for both places as far as the catered meal goes. You can order off of a an abridged menu, or choose a small buffet style.
My vote for food would have to go to the Howard Johnson's Garden Cafe.

I was the main A/V guy at our church for six years, unfortunately they don't have any portable units. I'll either rent one locally, or twist someone's arm here in town, so nobody has to bring one from afar.
